# CLASSIFICAÇÃO DOS DESENHOS TÉCNICOS

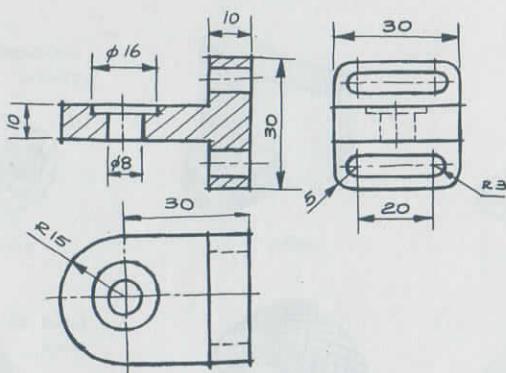

Os desenhos técnicos se classificam segundo os critérios seguintes:

## 1 - QUANTO AO ASPECTO GEOMÉTRICO

- a) Desenho projetivo: desenho resultante de projeções da peça sobre um ou mais planos, compreendendo as projeções ortogonais e as perspectivas.
- b) Desenho não projetivo: diagramas, esquemas, ábacos, nomogramas, fluxogramas, organogramas, gráficos, etc.

## 2 - QUANTO AO GRAU DE ELABORAÇÃO

- a) Croquis: Representação gráfica expedita. Aplicada habitualmente aos estágios iniciais da elaboração de um projeto ou à representação de elementos existentes ou à execução de obra. É executado à mão livre ou com instrumentos.

- b) Desenho preliminar: representação gráfica empregada nos estágios intermediários da elaboração do projeto, sujeito ainda a alterações. Corresponde ao ante-projeto.

c) Desenho definitivo: desenho integrante da solução final do projeto, contendo os elementos necessários à sua compreensão, de modo a poder servir à execução.

## 3 - QUANTO AO GRAU DE PORMENORIZAÇÃO

- a) Conjunto: desenho mostrando reunidos vários componentes, que se associam para formar um todo.
- b) Subconjunto: parte de um conjunto.
- c) Detalhe: desenho de componente isolado de um todo.

## 4 - QUANTO A FINALIDADE

- a) Fabricação      b) Montagem      c) Ilustração

## 5 - QUANTO AO MATERIAL EMPREGADO

- a) a lapis      b) à tinta  
em papel comum ou transparente

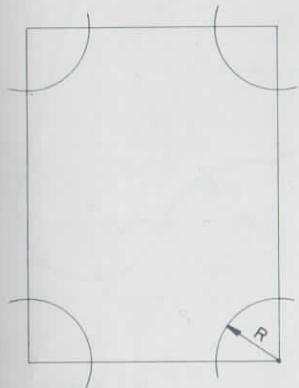

## 6 - QUANTO À TÉCNICA DE EXECUÇÃO

- a) à mão livre      b) com instrumentos

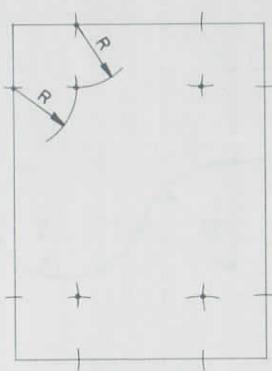

## 7 - QUANTO À NATUREZA

- a) Original
- b) Cópia: heliográfica, fotográfica (ampliação, redução), etc.

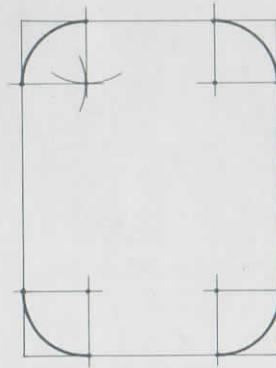

# SEQUÊNCIA DO TRAÇADO DE CONCORDÂNCIAS

# SEQUÊNCIA DO TRAÇADO DE DESENHO A LÁPIS

1<sup>a</sup> etapa:

escolher as vistas

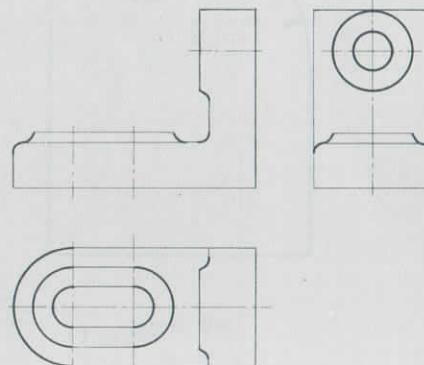

2<sup>a</sup> etapa:

estabelecer a escala

3<sup>a</sup> etapa:

dispor mentalmente as vistas, visando obter uma aparência bem equilibrada sobre o papel.

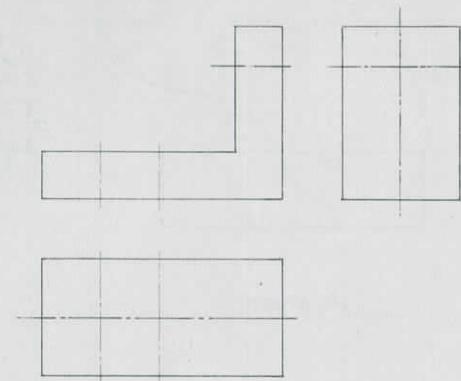

6<sup>a</sup> etapa: traçar as concordâncias, os arcos e as circunferências com grafite HB.

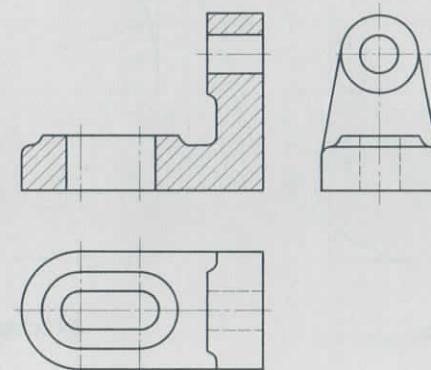

4<sup>a</sup> etapa: traçar as linhas de centro com lápis F.

5<sup>a</sup> etapa: traçar o contorno com lápis F.

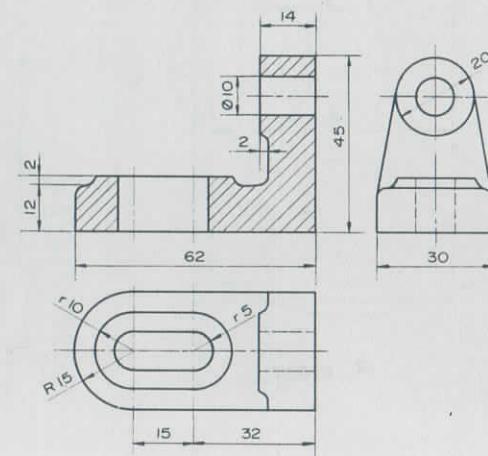

7<sup>a</sup> etapa: reforçar o desenho com lápis HB e hachurar com lápis F.

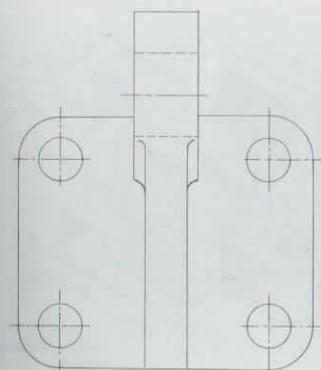

8<sup>a</sup> etapa: colocar as cotas e as observações com lápis HB.

9<sup>a</sup> etapa: fazer a verificação final.

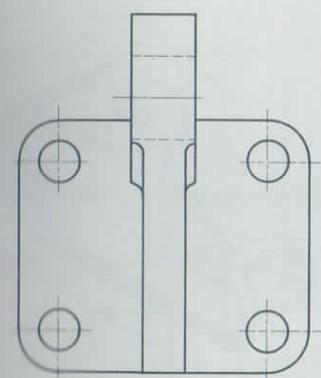

# SEQUÊNCIA DO TRAÇADO DE DESENHO A TINTA

1<sup>a</sup> etapa : fixar o papel vegetal sobre o desenho a lápis.  
Passar a borracha para remover a gordura do papel vegetal

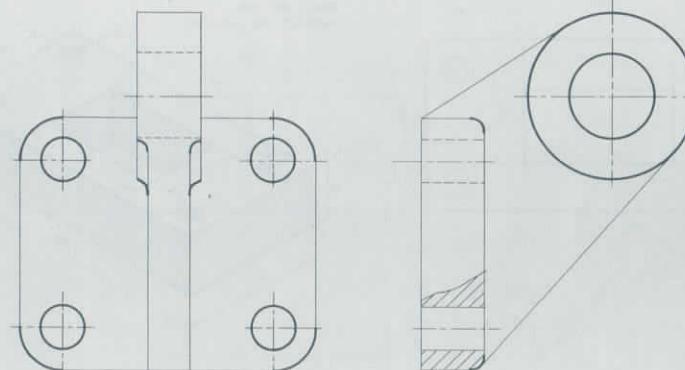

3<sup>a</sup> etapa : passar a tinta o restante do contorno com  
traco grosso.

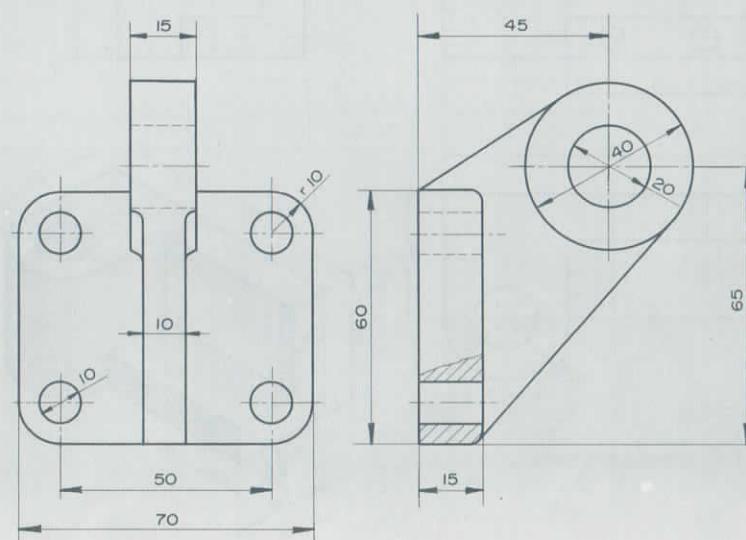

Normalmente são usadas para traço grosso pena 0,4 e para  
traco fino pena 0,1.

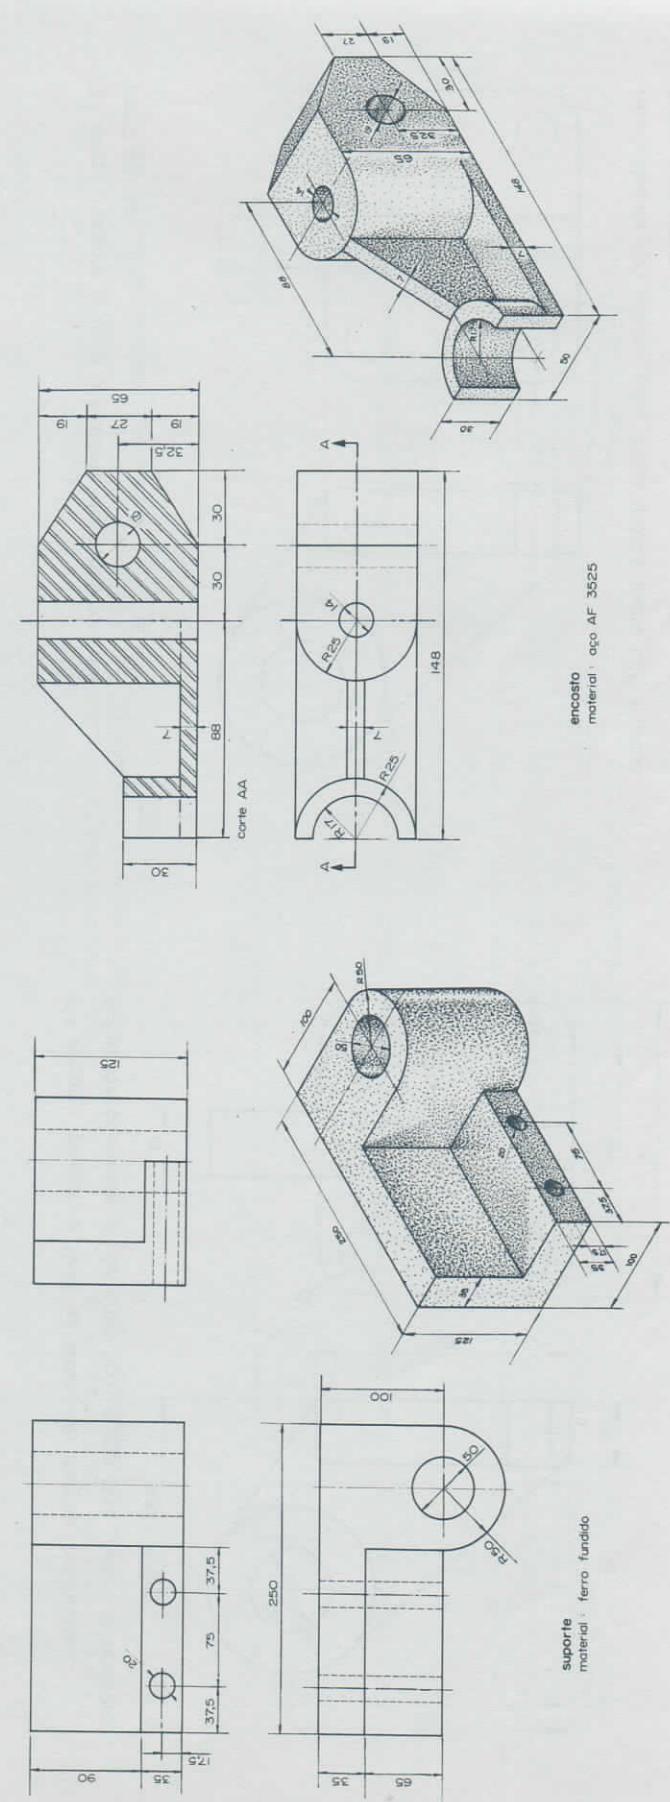

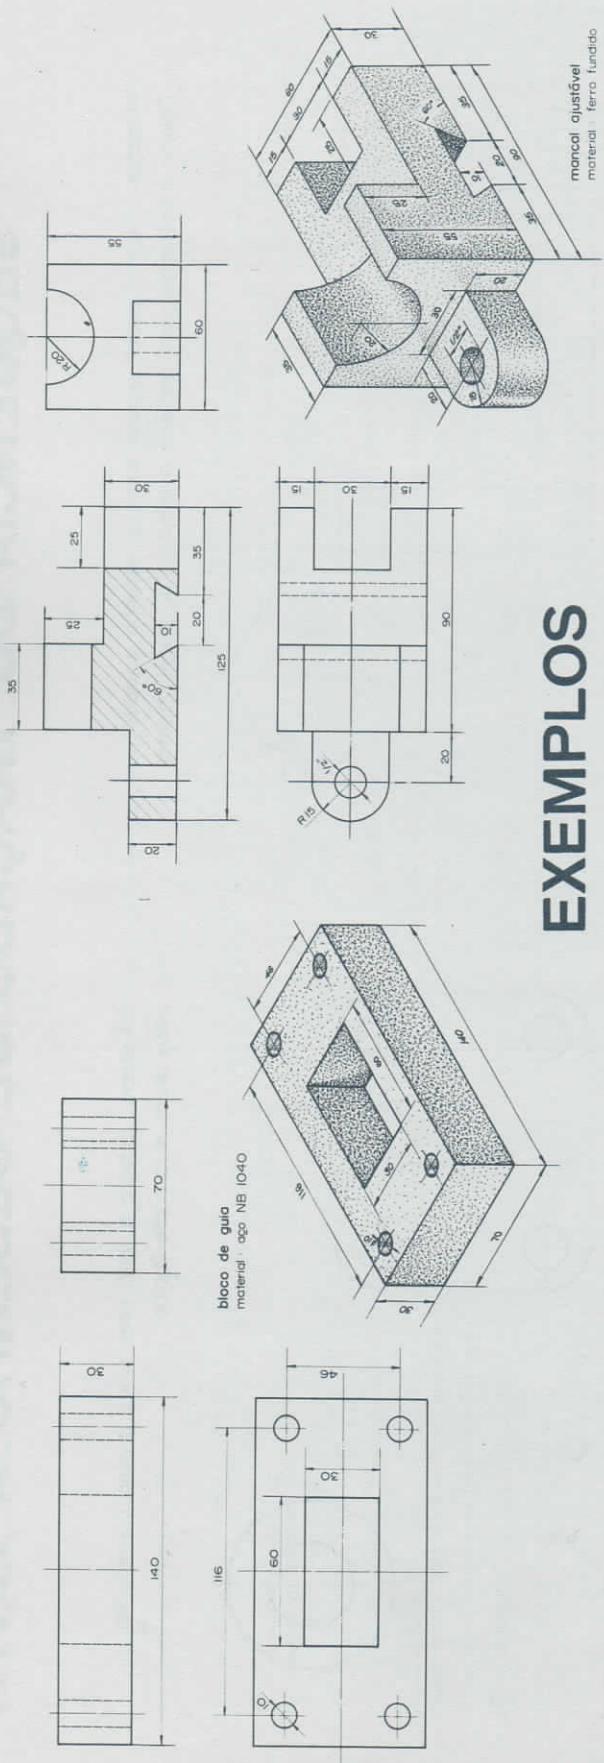

2<sup>a</sup> etapa : passar a tinta com traço grosso começando  
pelos arcos e circunferências.

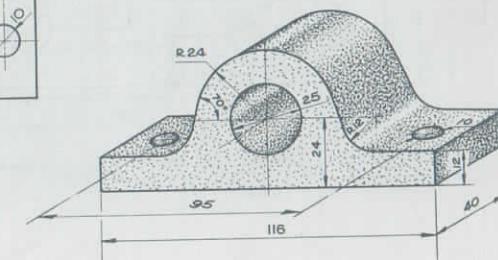

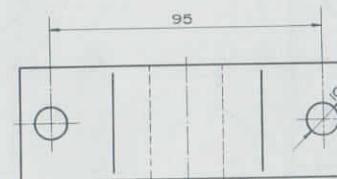

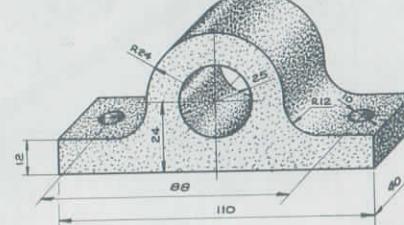

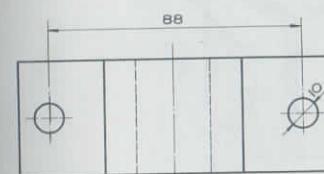

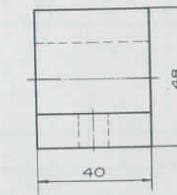

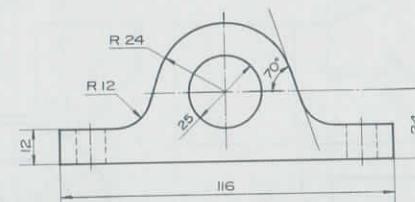

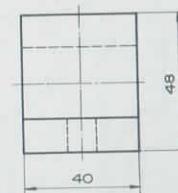

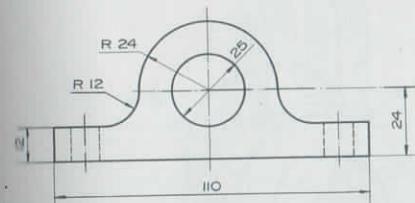

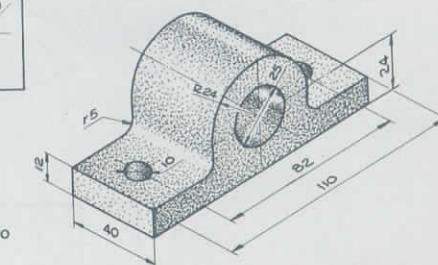

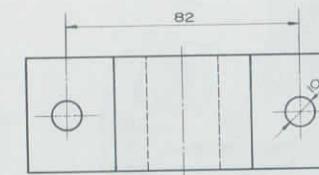

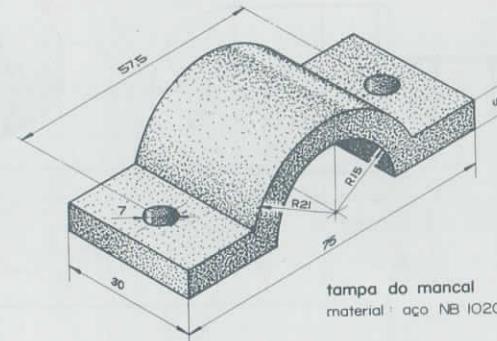

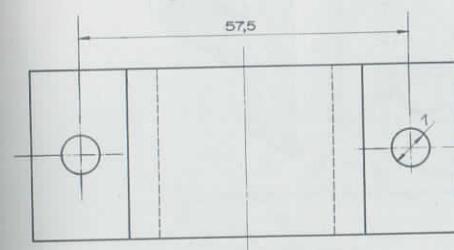

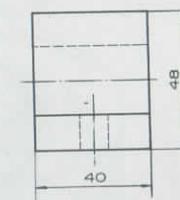

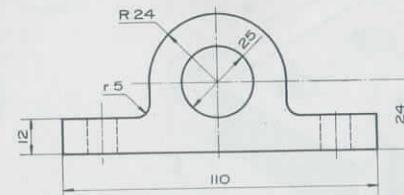

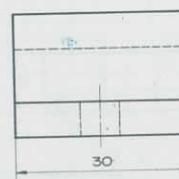

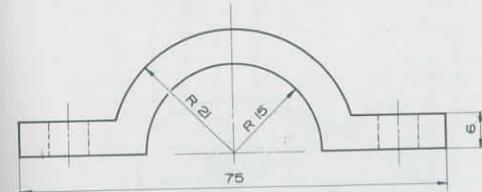

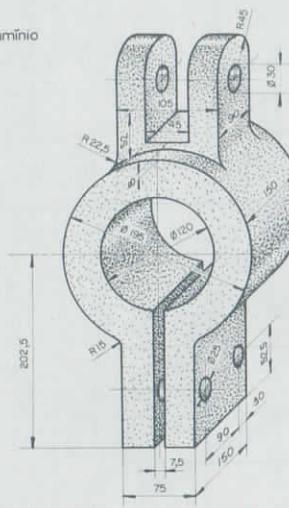

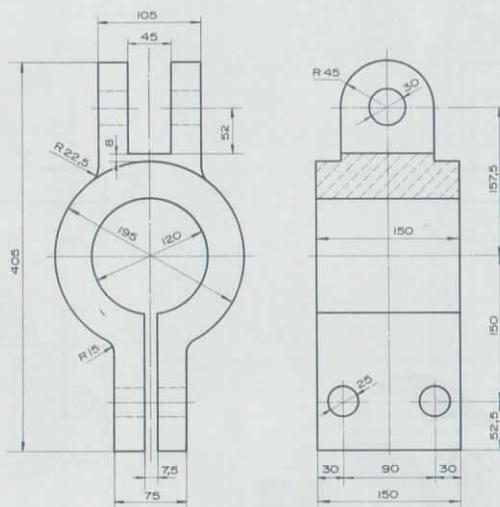

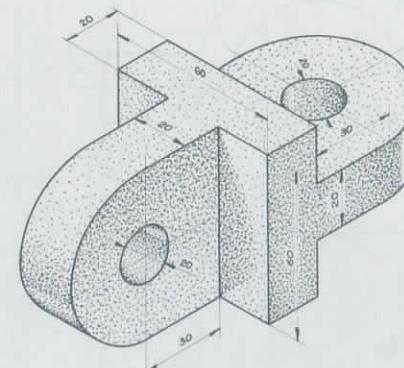

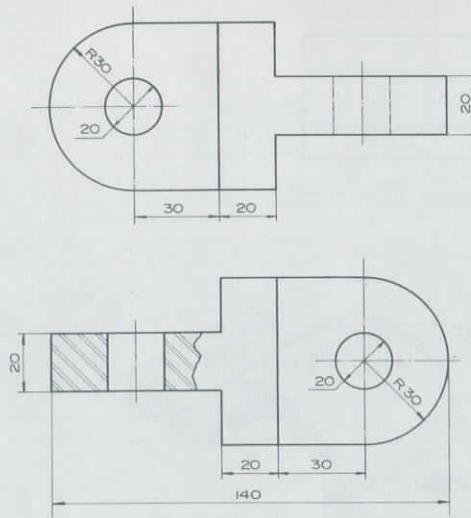

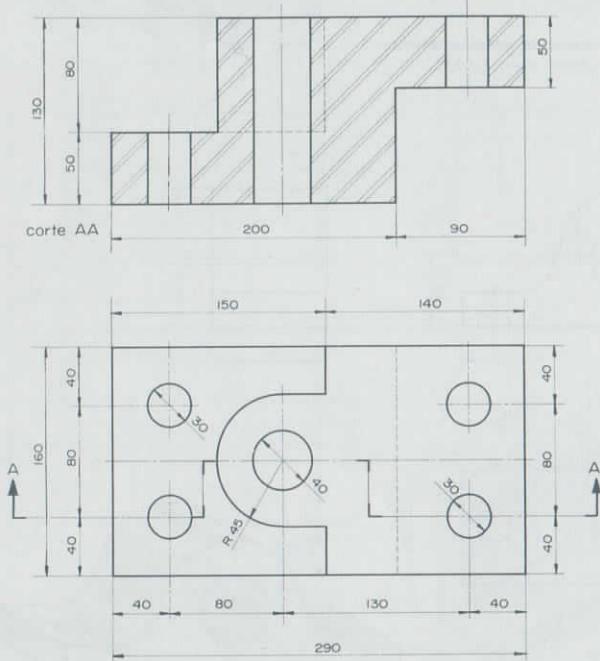

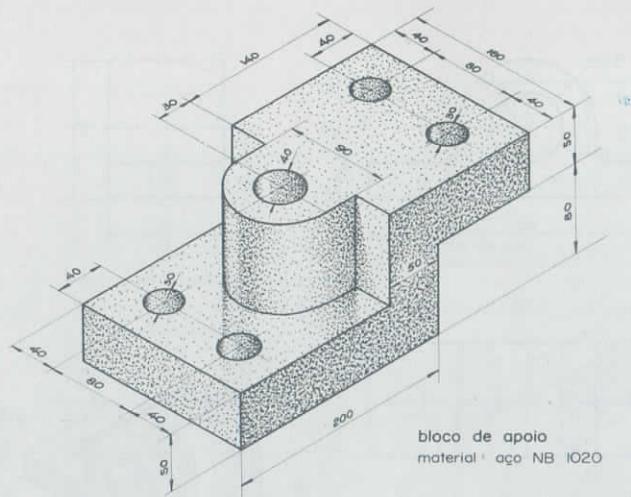

4<sup>a</sup> etapa : passar a tinta as linhas de centro, hachuras,  
linhas de chamada e de cota com traço fino. Cotar o desenho.

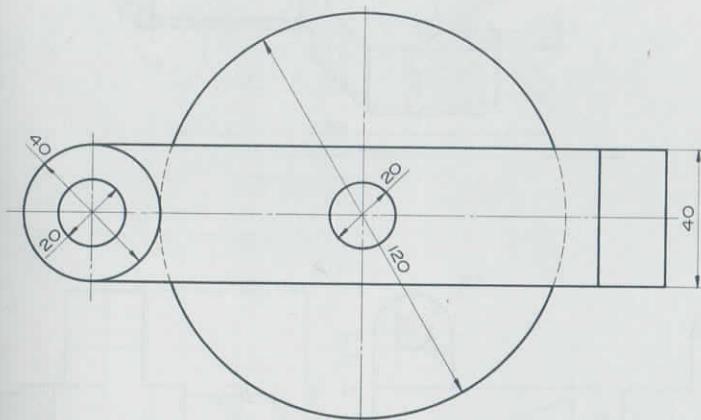

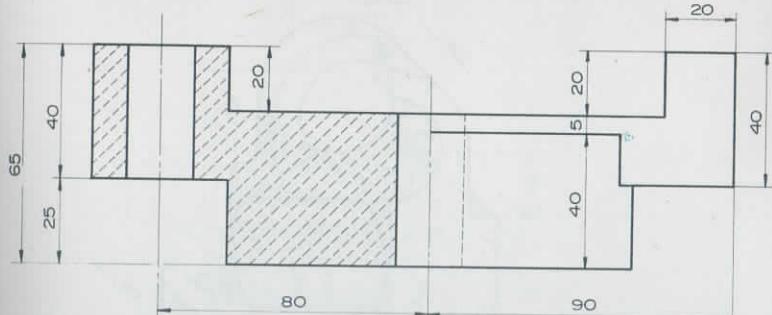

## EXEMPLOS

# INDICAÇÃO DAS ROSCAS

ROSCAS À DIREITA COM UMA ENTRADA			
Tipo	Símbolo	Medidas	Exemplo
Whitworth normal	—	Diâm. ext. da rosca em pol.	2"
Whitworth fina	W	Diâm. ext. em mm e passo em pol.	W 84 x 1/8"
Whitworth de tubos	R	Diâm. nominal do tubo em pol.	R 4"
Métrica normal	M	Diâm. ext. da rosca em mm.	M 80
Métrica fina	M	Diâm. ext. da rosca em mm e passo em mm.	M 104 x 4
Trapezoidal	Tr	Diâm. ext. da rosca em mm e passo em mm.	Tr 48 x 8
Redonda	Rd	Diâm. ext. da rosca em mm e passo em pol.	Rd 40 x 1/8"
Dentes de serra	S	Diâm. ext. da rosca em mm e passo em mm.	S 70 x 10
Edison	E	Diâm. nominal em mm.	E 27

ROSCAS À ESQUERDA OU COM VÁRIAS ENTRADAS				
Tipo da rosca	Abreviatura	Exemplos		Válido para
Gás e vapor	gás	M 20 gás	2" gás	Métrica, Whitworth e Whitworth de tubos
Esquerda	esq.	W 104 x 1/8" esq.	M 80 esq.	Whitworth Métrica
Várias entradas à direita	( 1 ent. )	2" ( 2 ent. )	Tr 48 x 16 ( 2 ent. )	Trapezoidal Redonda
Várias entradas à esquerda	esq. ( 1 ent. )	M 10 esq. ( 2 ent. )	Tr 48 x 16 esq. ( 2 ent. )	Dentes de serra

Parafuso

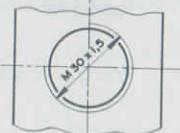

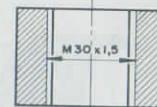

Parafuso com rosca Whitworth normal de diâm. 2"

Parafuso

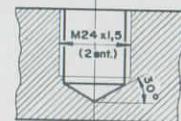

Parafuso com rosca Métrica normal de diâm. 30mm

Furo roscado passante

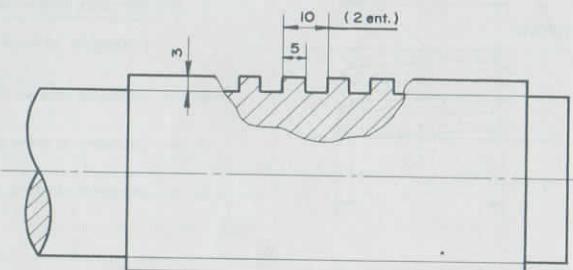

Furo roscado cego

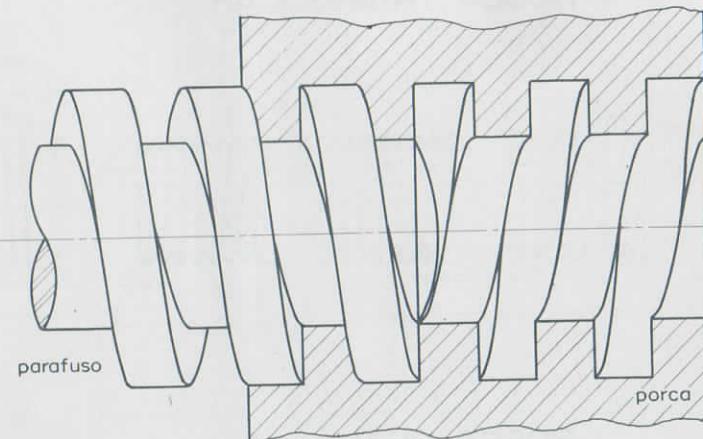

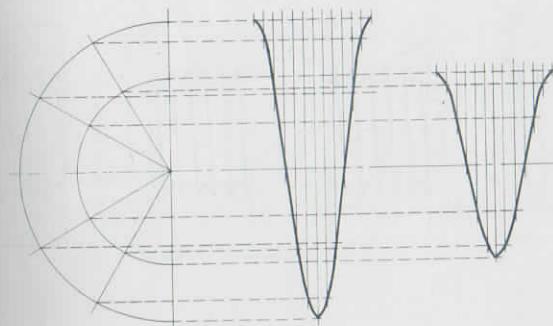

Rosca métrica fina de diâm. 30mm e passo 1,5mm.

As roscas quadradas têm a seguinte indicação:

# TRAÇADO DE ROSCAS

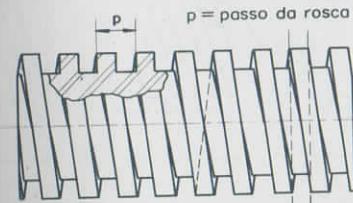

TRAÇADO EXATO DE UMA ROSCA

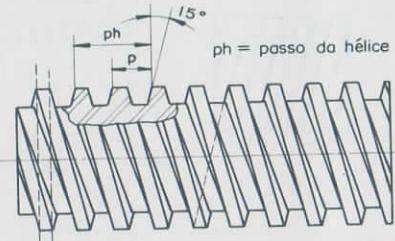

Observar a diferença entre o traçado do parafuso e da porca.

O traçado exato de uma rosca é raramente empregado nos desenhos a não ser em roscas de grandes diâmetros. Para casos comuns deve-se usar o traçado simplificado como nas figuras abaixo.

ROSCA QUADRADA COM UMA ENTRADA À DIREITA

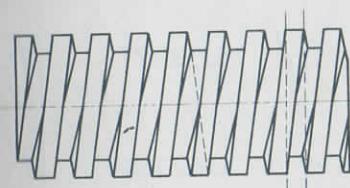

ROSCA TRAPEZOIDAL COM DUAS ENTRADAS À DIREITA

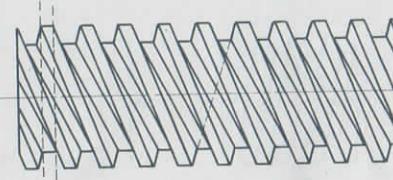

REPRESENTAÇÃO SIMPLIFICADA DE UMA ROSCA QUADRADA

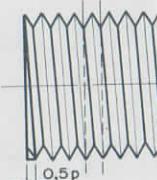

ROSCA QUADRADA COM UMA ENTRADA À ESQUERDA

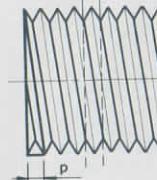

ROSCA TRAPEZOIDAL COM TRÊS ENTRADAS À DIREITA

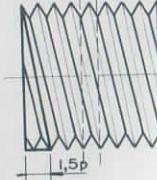

UMA ENTRADA

DUAS ENTRADAS

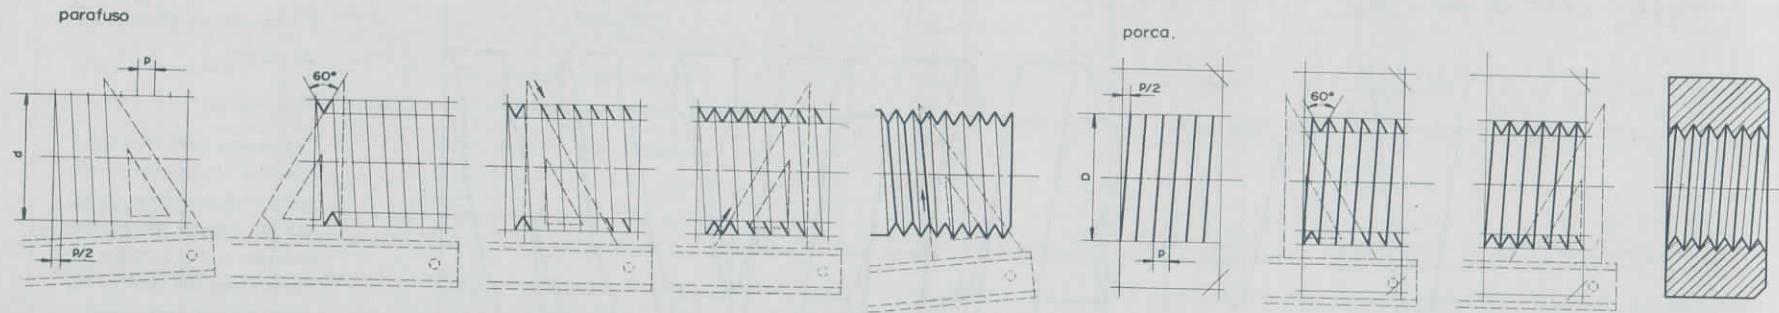

TRÊS ENTRADAS

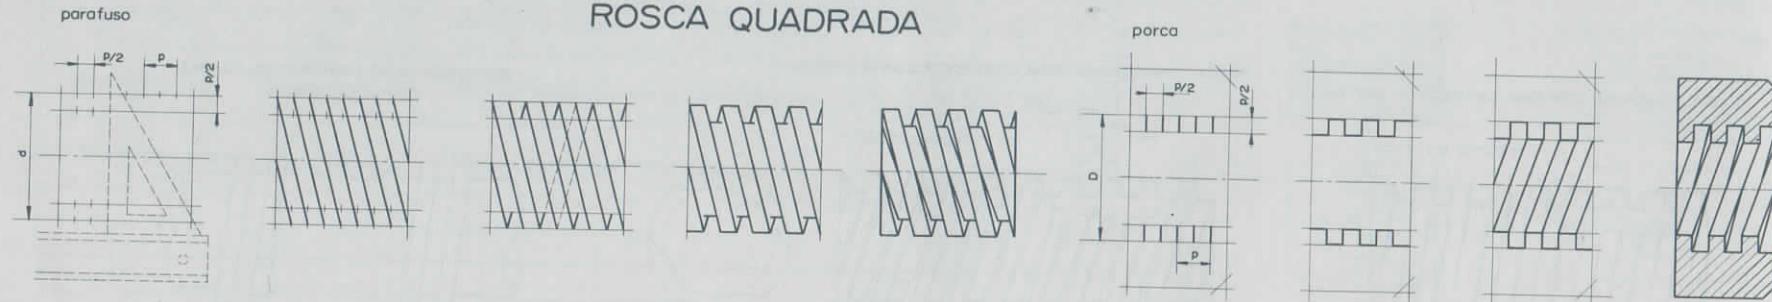

Observar pelas linhas tracejadas, perpendiculares à linha de centro do parafuso que nas roscas com número par de entradas o dente de um lado coincide com o dente do lado oposto e nas roscas com número ímpar de entradas, o dente de um lado coincide com o vão do lado oposto.

#### INDICAÇÃO SIMPLIFICADA PARA PEQUENOS DESENHOS. (DIN 30)

# PARAFUSOS E PORCAS ESPECIAIS

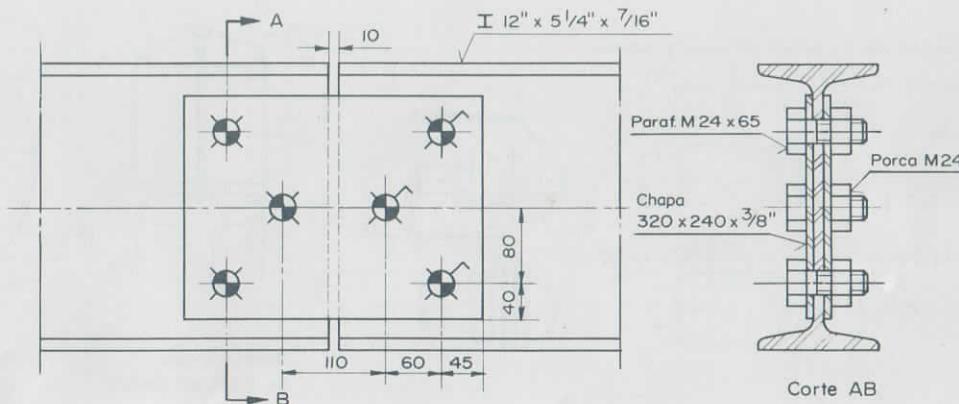

# SÍMBOLOS DE PARAFUSOS

Indicação da rosca	M 8	M 10	M 12	(M 14)	M 16	(M 18)	M 20	M 22	M 24	M 27	M 30	(M 33)	M 36
Diâmetro do parafuso (mm)	8	10	12	14	16	18	20	22	24	27	30	33	36
Secção do núcleo (mm <sup>2</sup> )	31,9	50,9	74,3	102	140	171	220	276	317	419	509	636	745
Diâmetro do furo (mm)	8,4	11	13	15	17	19	21	23	25	28	31	34	37
SÍMBOLOS CONVENCIONAIS	Parafuso com furo passante de série normal	8,4											
	Parafuso com furo passante fora de série												
	Furo rosado												
	Parafuso com cabeça embutida												
	Parafusar na montagem	8,4											
	Furar na montagem	8,4											

Até à escala 1:5 os símbolos convencionais serão representados com diâmetros iguais aos furos, para escalas menores usar-se-ão diâmetros iguais às cabeças dos parafusos.

Evitar os valores entre parênteses.

# INDICAÇÃO DO ACABAMENTO E TRABALHO SUPERFICIAL

Superfícies em bruto.

Superfícies em bruto, porém, limpas de rebarbas e saliências.

Superfícies apenas desbastadas

Superfícies alisadas

Superfícies polidas

Para qualquer outro acabamento, indicar ao lado o modo de obtê-lo.

Superfícies sujeitas a tratamento especial, são indicadas sobre uma linha horizontal.  
Ex.: temperado, niquelado, pintado, etc.

Estes sinais são indicados sobre as linhas de contorno da superfície em consideração, ou na impossibilidade, sobre as linhas de chama-  
da que saem desta.

O recartilhado é indicado da seguinte maneira:

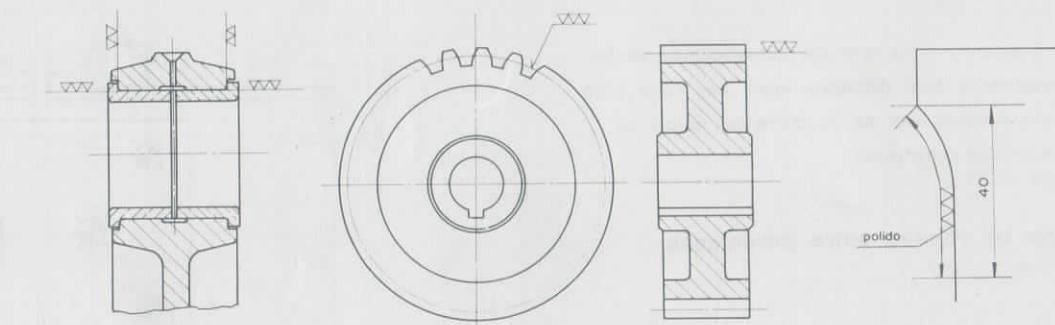

paralelo

paralelo 1,5

recart. paralelo 1,5

Em X

em X 0,8

Passos aconselhados – Paralelo: 0,5 – 0,8 – 1 – 1,5 mm  
Em X : 0,5 – 0,8 – 1 – 1,5 – 2 mm

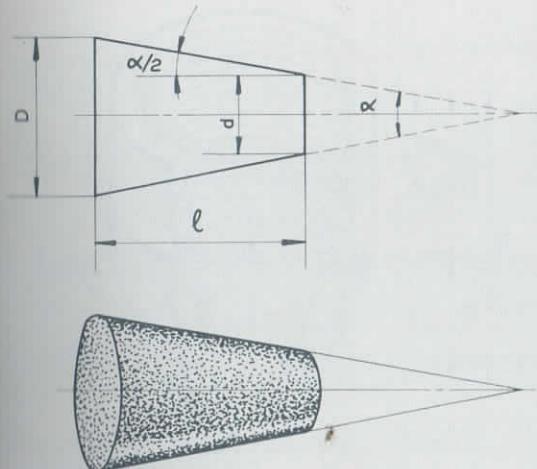

Neste exemplo:  
As faces em contato  
receberão, ambas, os  
mesmos acabamentos.

O acabamento dos dentes das engrenagens  
é indicado no diâmetro primitivo.

Se um determinado acabamento  
só se referir a uma parte da su-  
perfície, esta será indicada por  
uma linha de cota (com ou  
sem medida).

# CONICIDADE E INCLINAÇÃO

CONICIDADE é a relação  $(D-d) : l$

A conicidade é indicada paralelamente ao eixo, e seu valor pode ser calculado das seguintes maneiras:

$$k = \frac{l}{D-d} = \frac{100}{p\%} = \frac{1}{2} \cotg \frac{\alpha}{2}$$

$$p\% = 100 \frac{D-d}{l} = \frac{100}{K} = 200 \tg \frac{\alpha}{2}$$

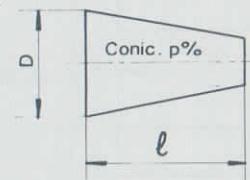

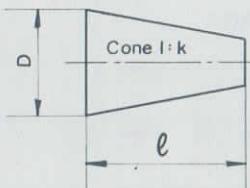

$$\alpha/2 = \text{arc } \tg \left( \frac{D-d}{2} : l \right) = \text{arc } \tg \frac{p\%}{200} = \text{arc } \cotg 2K$$

CONICIDADES PADRONIZADAS

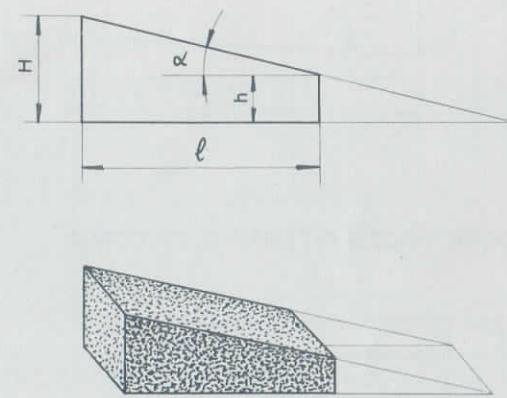

a) Cone Morse

Nº	Conicidade $l:k$
0	$l : 19,212$
1	$l : 20,047$
2	$l : 20,020$
3	$l : 19,922$
4	$l : 19,254$
5	$l : 19,002$
6	$l : 19,180$

b) Cone métrico: Conicidade  $l:20 = 5\%$

INCLINAÇÃO é a relação  $(H-h) : l$

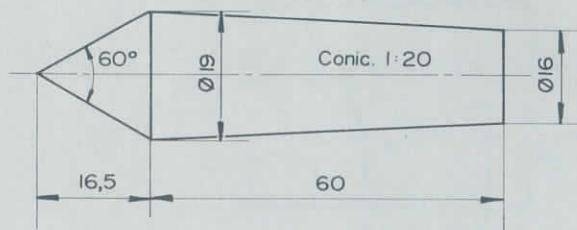

A inclinação é indicada paralelamente a face inclinada e seu valor pode ser calculado das seguintes maneiras.

$$k = \frac{l}{H-h} = \frac{100}{p\%} = \cotg \alpha$$

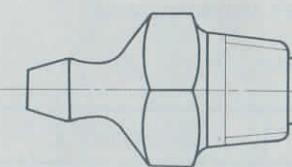

$$p\% = 100 \frac{H-h}{l} = \frac{100}{K} = 100 \tg \alpha$$

$$\alpha = \text{arc } \tg \left( \frac{H-h}{l} \right) = \text{arc } \tg \frac{p\%}{100} = \text{arc } \cotg K$$

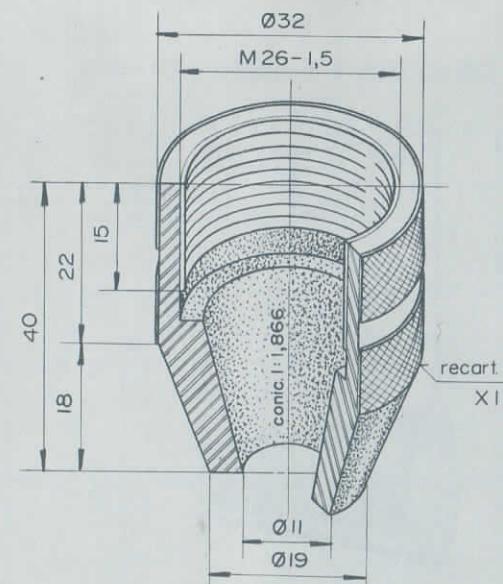

CONTRA-PINO FIXO

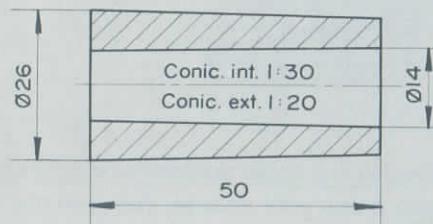

ENGRAXADEIRA LUB

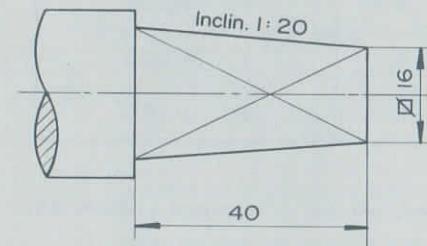

CAPA DO MANDRIL

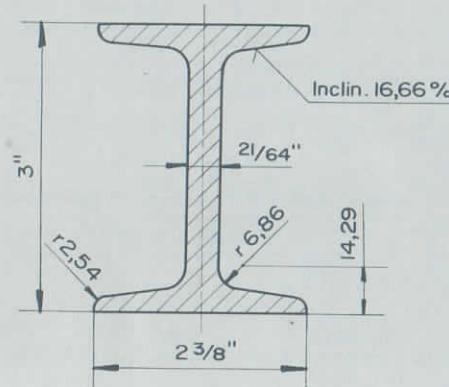

CONICIDADES INTERNA E EXTERNA

CHAVETA ENCAIXADA

# PINOS E CONTRA-PINOS

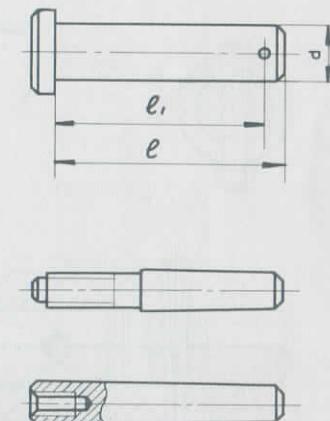

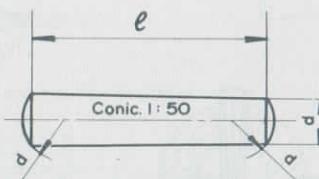

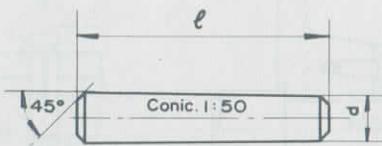

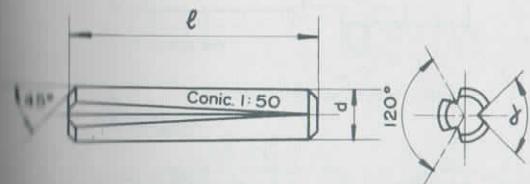

## PINOS CILÍNDRICOS

Comprimentos  $l$  normais: 8-9-10-12 ... 22-25-28-30-35 ... 150-160 ... 320

Indicação de um pino  $d \times l \times l_1$ , Exemplos: Pino cil. sem cabeça 65x95x70  
 Pino cil. com cabeça 10x35x31,5

## PINOS CÔNICOS

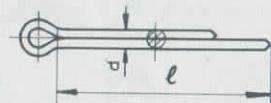

O diâmetro indicativo do pino cônicos é o menor.

Comprimentos  $l$  normais: 4 - 6 ... 32 - 36 - 40 - 45 ... 150 - 165 - 180 - 200 - 230 - 260

Indicação de um pino cônicos: Pino cônicos  $d \times l$  Ex.: Pino cônicos 4x35

## CONTRA-PINO

Material: aço

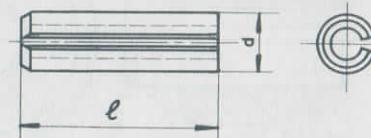

Material: outro metal

Indicação de um contra-pino

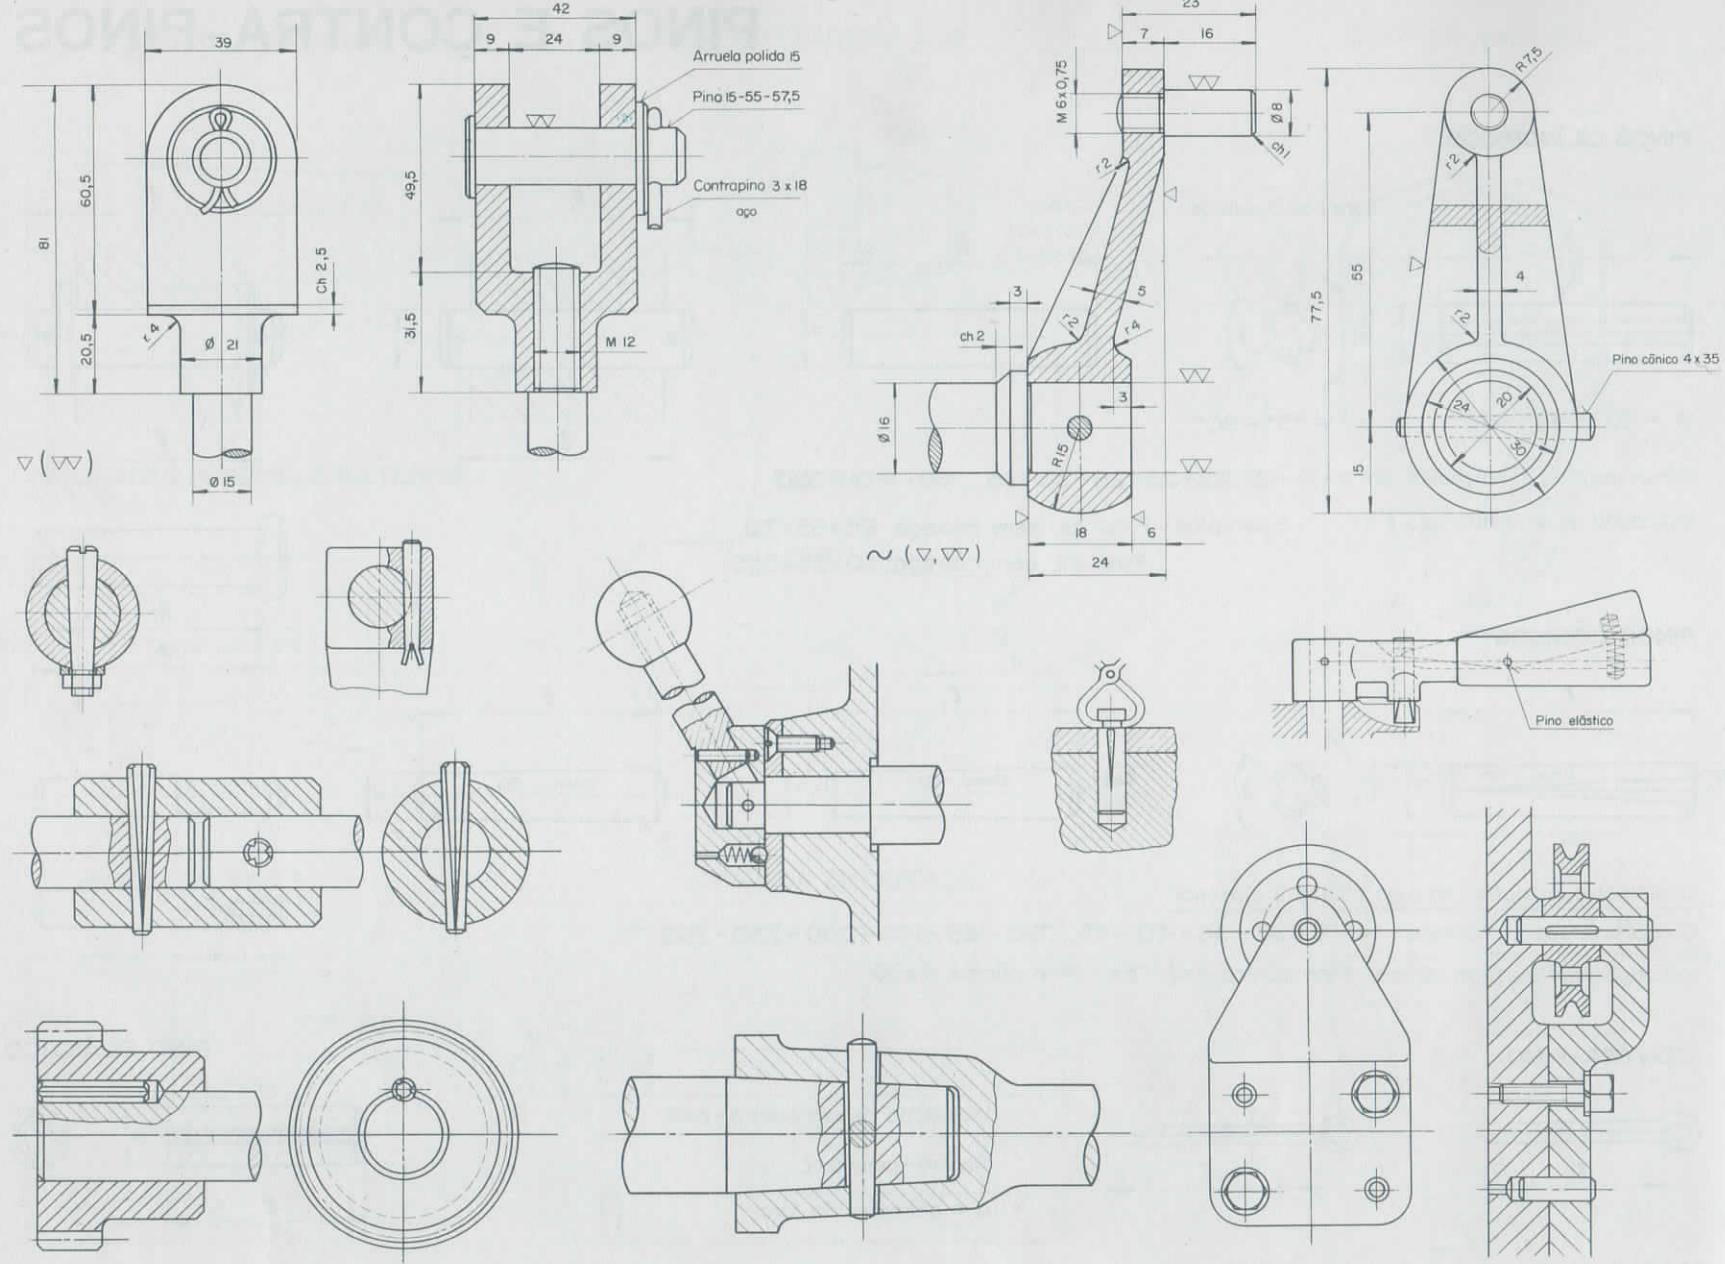

Contra-pino  $d \times l$

$d$  = diâmetro do furo

## PINO ELÂSTICO

Indicação: Pino elástico  $d \times l$

# CHAVETAS E LINGUETAS

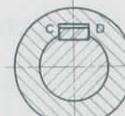

Chaveta

Chaveta deslizante  
(extremidades redonda)

Chaveta deslizante  
(extremidades retas)

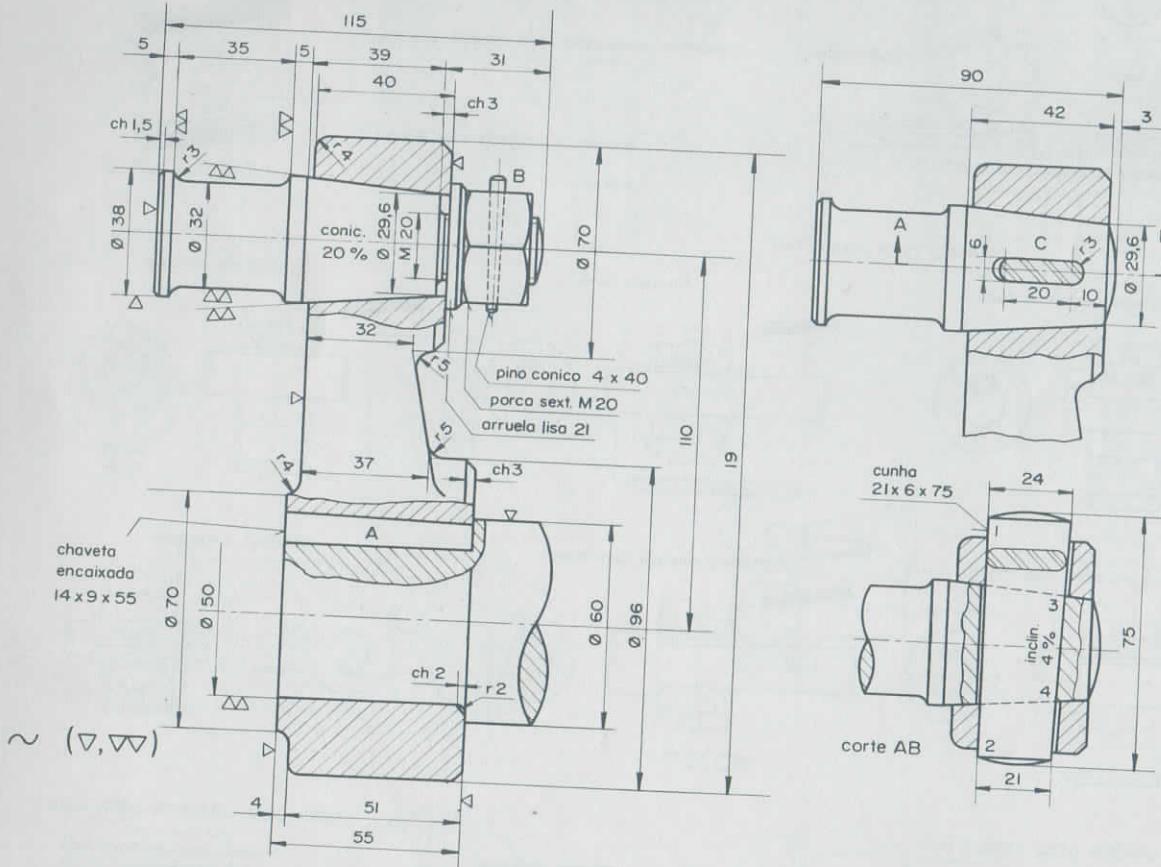

Chaveta meia-lua, americana  
ou WOODRUFF

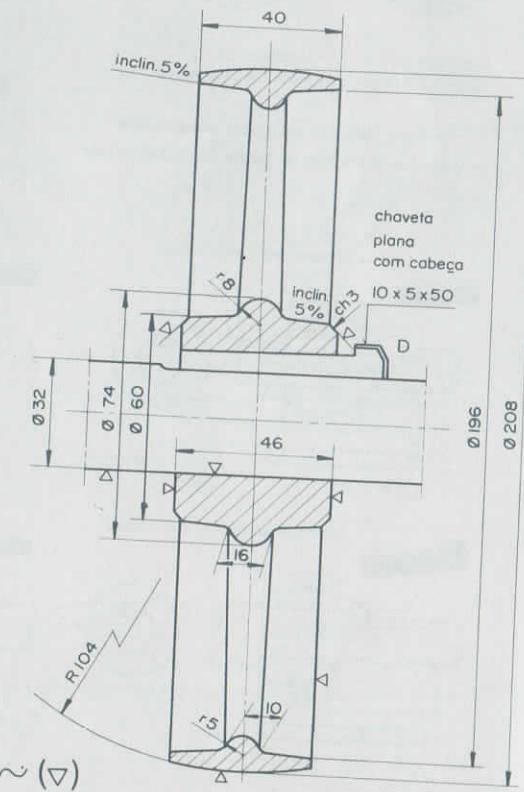

# UNIÕES FORÇADAS - EFEITO DE CUNHA

MANIVELA DE EXTREMIDADE

A união do eixo com a manivela é obtida por meio da chaveta encaixada (A). O pino da manivela é forçado no seu lugar por meio da porca (B) na qual é colocado um pino cônic de segurança.

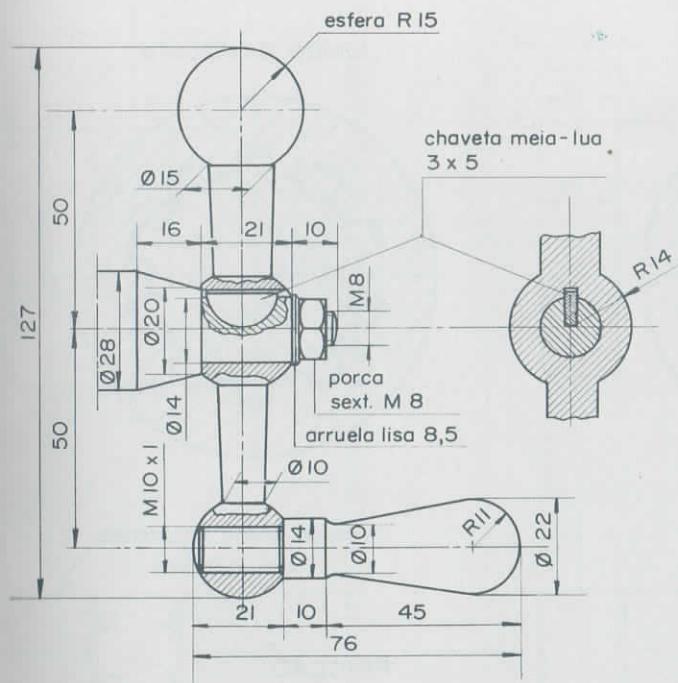

POLIA PARA CORREIA PLANA

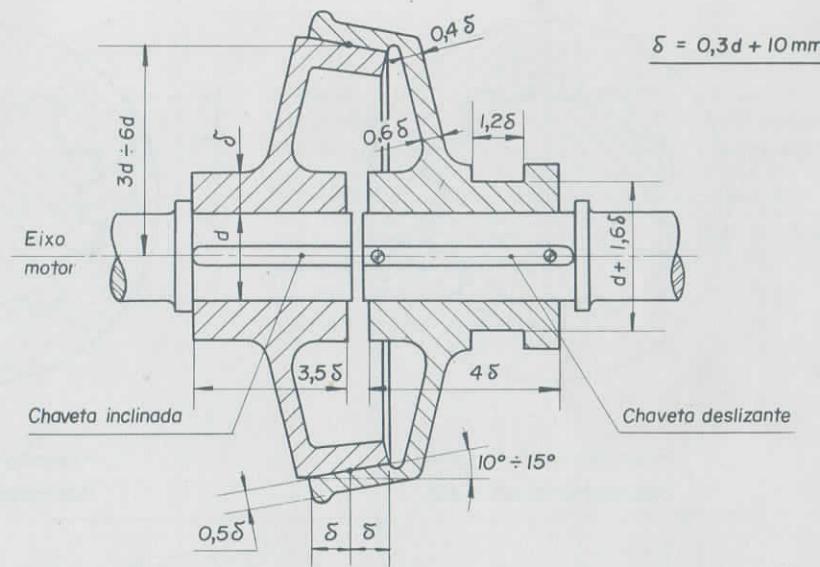

O mesmo pino pode ficar em união forçada com a manivela por meio da cunha C. Observar que a cunha força contra a parede 1-2 do furo da manivela e contra a parede oposta 3-4 do furo do pino.

A união é obtida por meio da chaveta plana com cabeça (D). Observar que não há encaixe no eixo e sim um simples aplaçamento.

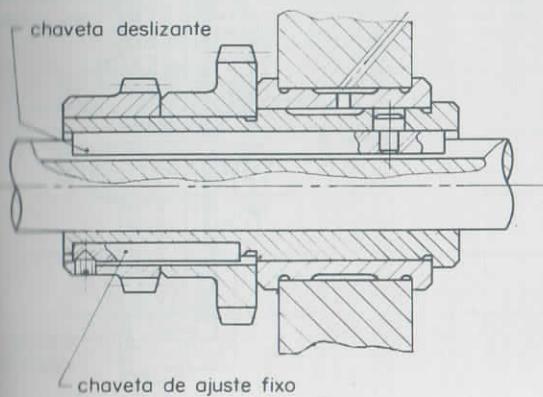

## MANIVELA DE COMANDO

## JUNTAS

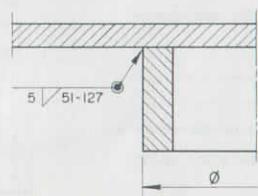

## ENTALHES DUPLOS

## LADO OPOSTO E LADO SETA

## EXEMPLO

### Significado

- Cordão de solda do lado seta.
- Grossura do cordão : 5 mm
- Cordão de solda angular
- Solda descontínua em todo contorno
- Comprimento dos trechos de solda : 51 mm
- Passo : 127 mm
- Solda na montagem

## OBSERVAÇÕES

1 - Aplicar as setas tantas vezes quantas forem as mudanças bruscas na direção do cordão, exceto quando o cordão for o mesmo para todo o contorno, caso em que será empregado o símbolo correspondente.

2 - Todos os cordões são considerados contínuos, exceto quando indicado em contrário.

3 - As dimensões colocadas nos símbolos são indicadas sempre em mm.

4 - Usar a cauda da seta para especificar particularidades da soldagem se houver, caso contrário omiti-la.

5 - Nas soldas do lado seta, representar o símbolo no lado inferior da seta acontecendo o contrário para as soldas do lado oposto.

6 - Nos entalhes duplos, representar os símbolos, em ambos os lados da seta.

7 - Indicar as dimensões de uma solda somente uma vez quando em ambos os lados da emenda ela é do mesmo tipo e tamanho, caso contrário indicar as dimensões em ambos os lados.

8 - Onde somente um dos elementos sofrer entalhe, representar a seta, indicando precisamente aquele elemento com mudança brusca de direção da seta.

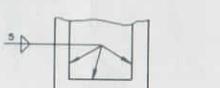

9 - Na colocação da seta na posição vertical seguir o mesmo procedimento usado para colocação de cotas.

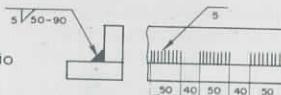

10 - Indicar o comprimento próprio de cada solda em combinação com a linha de cota.

11 - Representar as soldas nas mudanças bruscas de direção conforme indica o desenho ao lado, exceto, quando se usar o símbolo de solda de contorno.

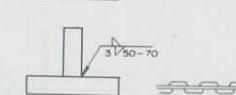

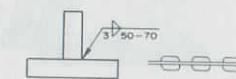

12 - Quando se quer representar o contorno real do cordão proceder da seguinte maneira:

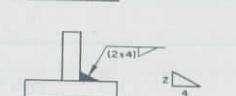

13 - Representar os símbolos com o traço vertical sempre no lado esquerdo.

14 - Representar a solda em cadeia da seguinte maneira:

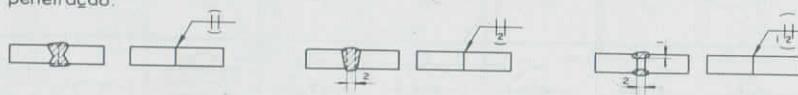

15 - Representar a solda escalonada da seguinte maneira:

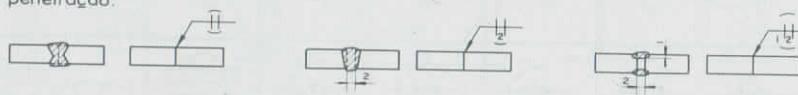

significado

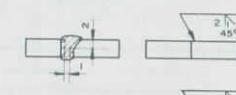

16 - Quando o cordão de solda angular, fizer um ângulo diferente de 45°, indicar da seguinte maneira:

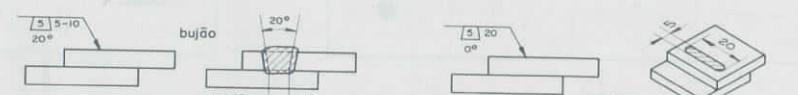

17 - Indicar o lado em que é feita a solda de recorte reto, por meio do símbolo da solda convexa ou raso. Quando a penetração da solda não é completa, indicar a penetração.

18 - Indicar a profundidade do entalhe das soldas de recorte em V ou em bisel quando o entalhe não for completo. Caso contrário dispensar a indicação.

19 - Indicar as soldas de ranhura e de bujão da seguinte maneira:

20 - Indicar qualquer solda que não é feito na oficina assim:

21 - Indicar as soldas em todo o contorno assim:

22 - Indicar solda com cordão raso, sem recurso de acabamento assim:

23 - Indicar solda com cordão raso e com acabamento utilizando os respectivos símbolos de usinagem.

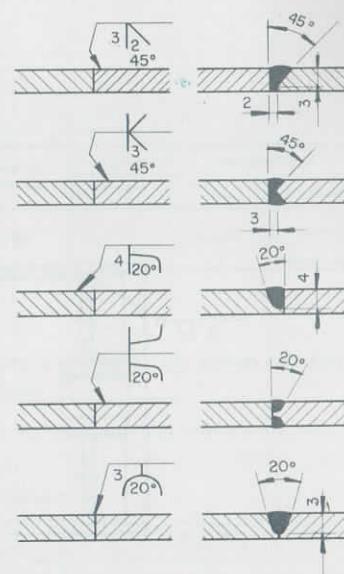

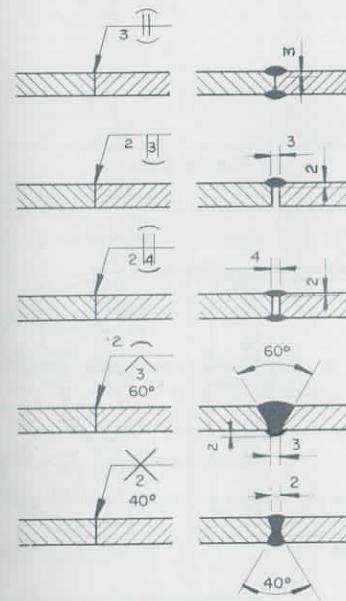

24 - Indicar cordão de enchimento assim:

# EXEMPLOS DE SOLDA A ARCO

# SOLDA COM RESISTÊNCIA ELÉTRICA - NORMA AMERICANA

## SÍMBOLOS

Tipo de solda				solda na montagem	solda em todo o contorno	Acabamento	
por pontos	por saliências	por costura	de topo			liso	c/rebordo
*      X	X	XXX		●	○	—	(solda de topo)

## OBSERVAÇÕES

1 - Na solda com resistência elétrica, a designação lado seta e lado oposto não tem significado, a não ser no caso de solda por saliências.

2 - Indicar as soldas com resistência elétrica pelo esforço que são capazes de resistir e não por suas dimensões.

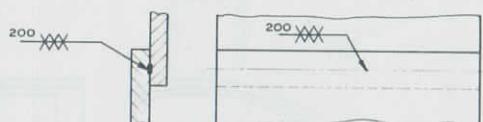

3 - Representar a solda por pontos da seguinte maneira:

  
R = resistência ao cisalhamento de cada ponto em kg.  
p = passo em mm

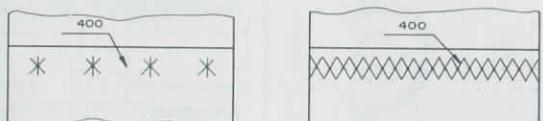

4 - Representar a solda por costura da seguinte maneira:

  
R = resistência ao cisalhamento em kg/cm de solda

5 - Os símbolos de solda por pontos ou por costura podem ser usados diretamente nos desenhos.

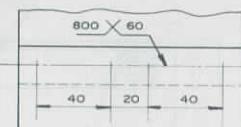

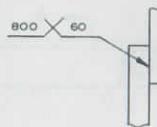

6 - A solda é considerada com costura, quando os pontos são tangentes ou se sobrepõem em parte. Existindo qualquer espaço entre os pontos, será considerada por pontos em série e, neste caso, empregar-se-á o símbolo da solda por pontos.

7 - Representar a solda por saliências da seguinte maneira:

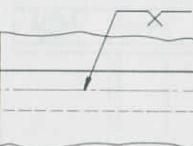

R = resistência ao cisalhamento de cada saliência em kg.

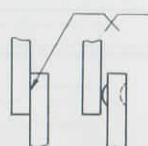

p = distância de centro a centro de lances em mm.

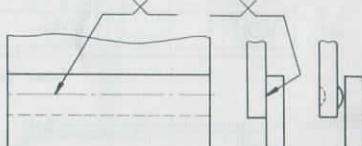

8 - Indicar na solda por saliências o lado que fica em relevo da seguinte maneira:

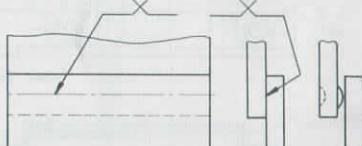

elevação

perfil significado

elevação

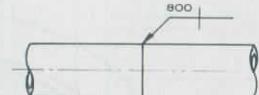

perfil significado

9 - Representar a solda de topo da seguinte maneira:

R = resistência à tração em kg/cm²

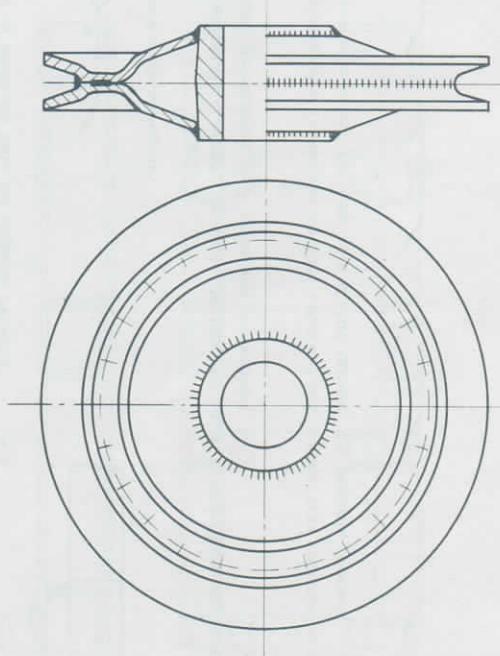

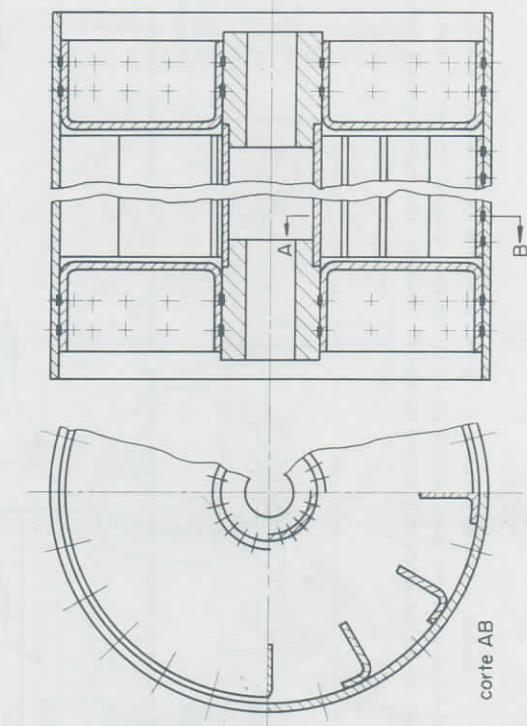

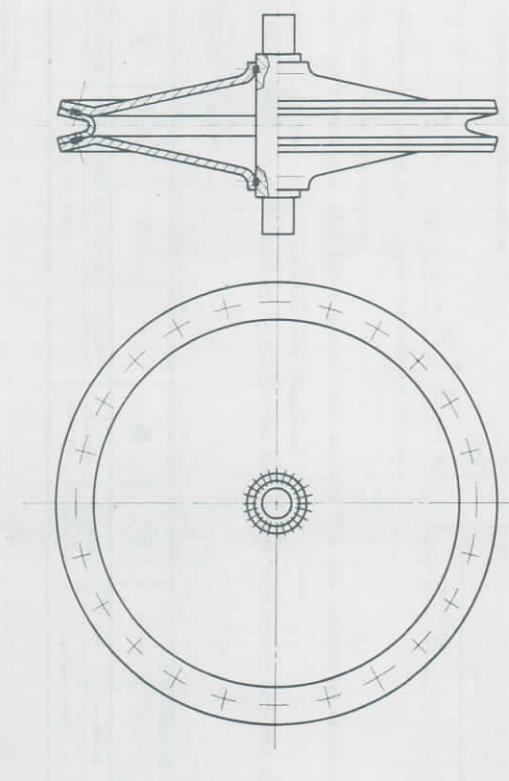

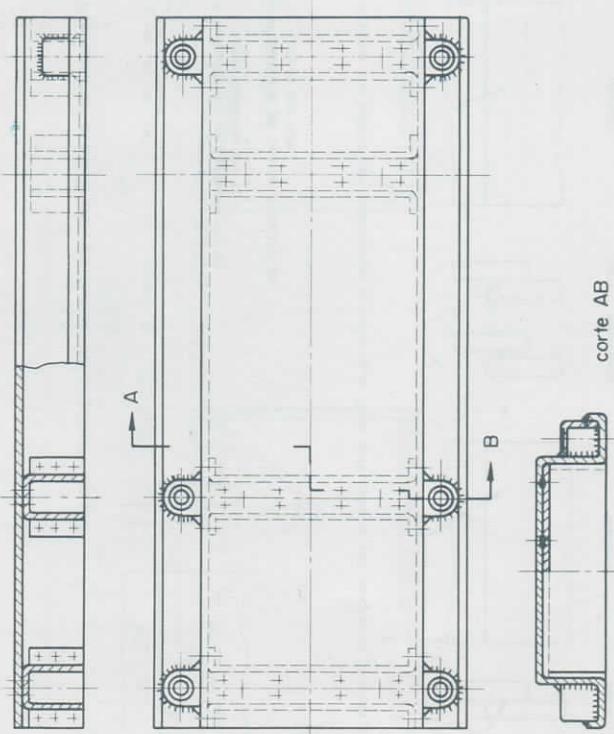

10 - Quando a resistência à tração da solda de topo for igual à resistência da secção do metal soldado, a indicação de R pode ser dispensada.

II - Indicar o acabamento (solda lisa ou com rebordo) das soldas com resistência elétrica, obedecendo o significado do lado seta e lado oposto, da seguinte maneira:

# TOLERÂNCIAS E AJUSTES

1 - Dimensão efetiva: valor obtido medindo a peça.

2 - Dimensão máxima  $D_{máx}$ : valor máximo admissível para a dimensão efetiva.

3 - Dimensão mínima  $D_{mín}$ : valor mínimo admissível para a dimensão efetiva.

4 - Tolerância  $t$ : variação permitível da dimensão da peça, dada pela diferença entre a dimensão máxima e a mínima.

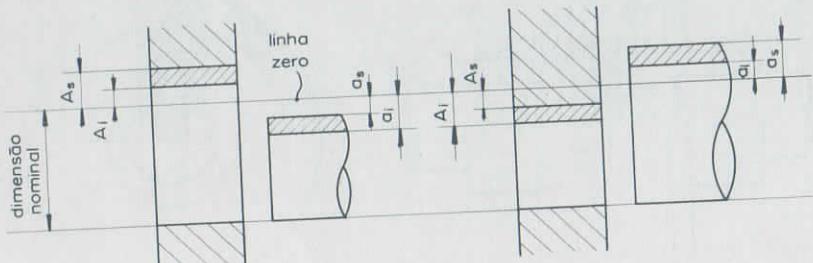

$$t = D_{máx} - D_{mín}$$

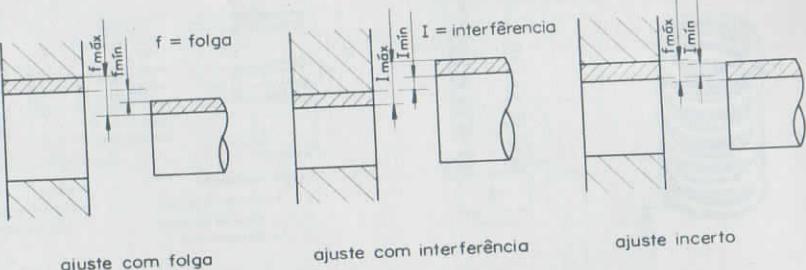

5 - Linha zero: linha que nos desenhos fixa a dimensão nominal e serve de origem aos afastamentos.

6 - Afastamento inferior: diferença entre a dimensão mínima e a nominal. Símbolos:  $A_i$  para furo,  $a_i$  para eixo.

7 - Afastamento superior: diferença entre a dimensão máxima e a nominal. Símbolos:  $A_s$  para furo,  $a_s$  para eixo.

8 - Ajuste: comportamento de um eixo num furo, ambos da mesma dimensão nominal, caracterizado pela folga ou interferência apresentada.

9 - Eixo: termo convencionalmente aplicado para fins de tolerâncias e ajustes, como sendo qualquer parte de uma peça cuja superfície externa é destinada a alojar-se na superfície interna de outra.

10 - Eixo base: é o eixo em que o afastamento superior é preestabelecido como sendo igual a zero.

11 - Furo: termo convencionalmente aplicado para fins de tolerâncias e ajustes, como sendo todo espaço delimitado por superfície interna de uma peça e destinado a alojar o eixo.

12 - Furo base: é o furo em que o afastamento inferior é preestabelecido como sendo igual a zero.

13 - Sistema de ajuste: conjunto de princípios, regras, fórmulas e tabelas que permite a escolha racional de tolerâncias no acoplamento eixo-furo, para se obter economicamente uma condição preestabelecida.

14 - Sistema de tolerância: conjunto de princípios, regras, fórmulas e tabelas que permite a escolha racional de tolerâncias para a produção econômica das peças mecânicas intercambiáveis. (v. tabelas do "Prontuário do Projetista de Máquinas".)

15 - A escolha das tolerâncias é feita por meio de fórmulas ou por meio de tabelas.

16 - A qualidade de trabalho (campo de tolerância) é designada por números: O1, O, I, 2, ..., 15, 16 na ordem decrescente de qualidade.

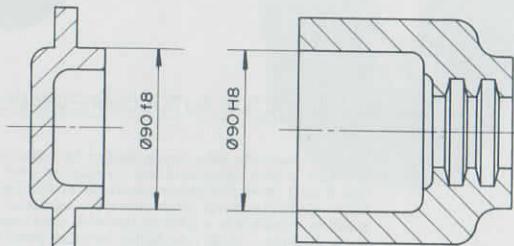

17 - A posição dos campos de tolerância em relação à dimensão nominal é designada por letras. As letras maiúsculas são reservadas para os furos e as minúsculas para os eixos.

furos : A, B, C, ..., Y, Z

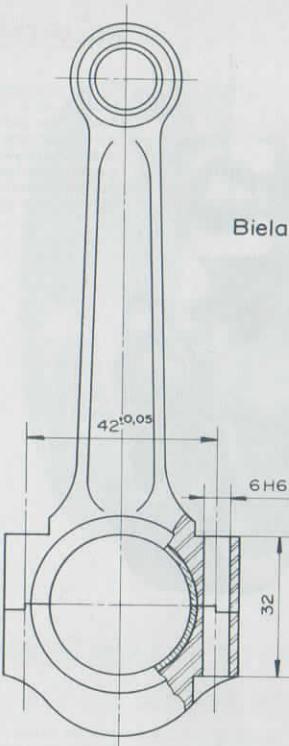

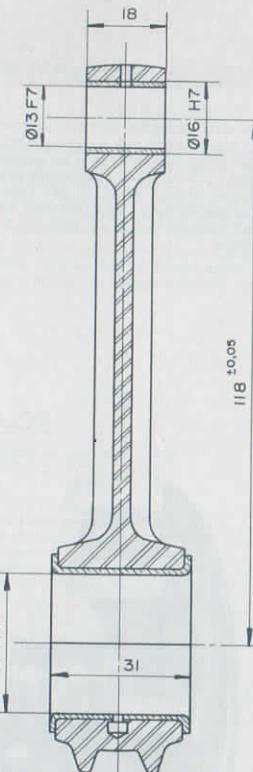

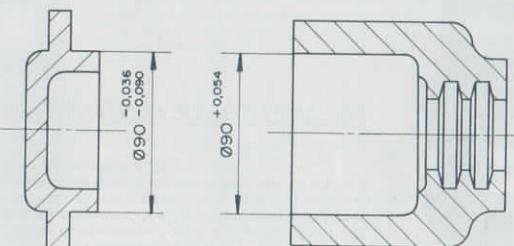

eixos : a, b, c, ..., y, z

18 - A indicação da tolerância é feita por meio de símbolos. Cada símbolo é formado acrescentando à letra do campo o número indicativo da qualidade.

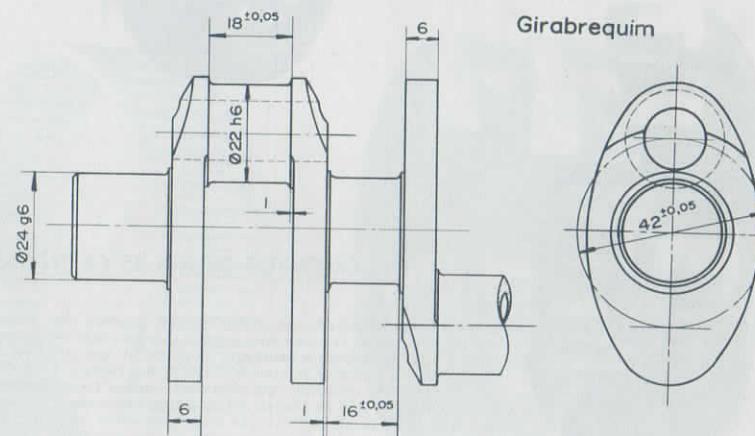

Exemplo : Eixo f8 e furo H8.

19 - A indicação da tolerância também pode ser feita colocando-se diretamente sobre o desenho os valores obtidos em tabelas.

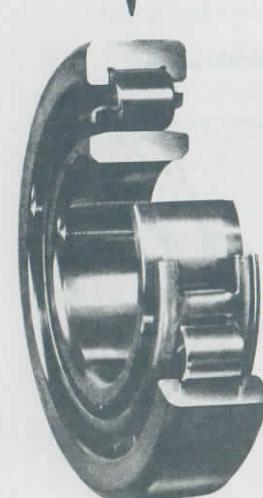

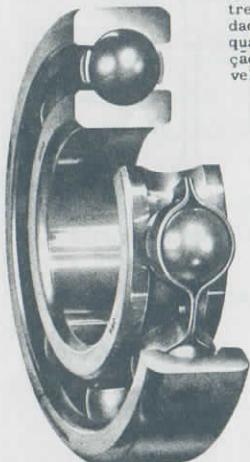

Girabrequim

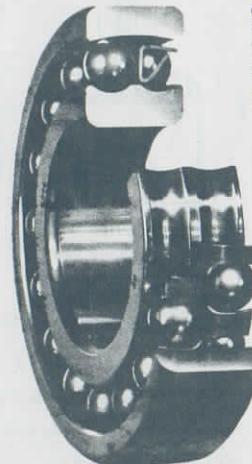

### ROLAMENTOS FIXOS DE UMA CARREIRA DE ESFERAS

O rolamento fixo de uma carreira de esferas tem pistas profundas, sem orifício para a entrada das esferas. Graças a profundidade das pistas, ao tamanho das esferas e ao íntimo contacto entre as esferas e as pistas, possui esse rolamento grande capacidade de carga, inclusive no sentido axial. É por isso muito adequado para resistir a cargas de todas as direções. Sua construção lhe permite suportar consideráveis cargas axiais, mesmo a velocidades muito elevadas.

### ROLAMENTOS DE ROLOS CILÍNDRICOS

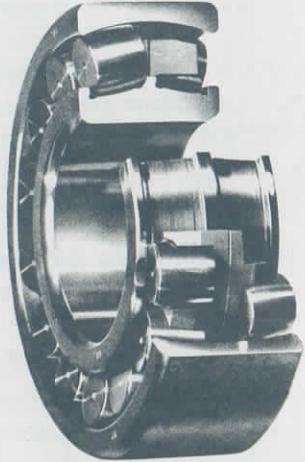

Os rolos do rolamento cilíndrico são guiados por rebordos em um dos anéis. O outro anel geralmente não tem rebordos. Esta execução apresenta a vantagem de permitir que o eixo se desloque axialmente dentro de certos limites, em relação à caixa. Os rolamentos com rebordos nos dois anéis podem fixar axialmente o eixo, sempre que as forças sejam muito reduzidas. A desmontagem é muito fácil, mesmo que ambos os anéis estejam montados com ajuste forte. Este rolamento é adequado para cargas relativamente grandes e pode também suportar altas velocidades.

## TIPOS DE ROLAMENTOS

### ROLAMENTOS AUTOCOMPENSADORES DE ESFERAS

O rolamento autocompensador de esferas tem duas carreiras de esferas e uma pista esférica comum no anel externo. Graças à esfericidade da pista, o rolamento é autocompensador, o que o torna insensível a ligeiros desalinhamentos do eixo, provenientes de montagem defeituosa, esforços sobre o eixo, desnível das fundações, etc. Pelo mesmo motivo, o rolamento não podeoccasionar flexões no eixo, o que é de grande importância quando se trata de aplicações em que se requer alta velocidade e exatidão.

### ROLAMENTOS AUTOCOMPENSADORES DE ROLOS

O rolamento autocompensador de rolos tem duas carreiras de rolos e uma pista esférica comum no anel externo, característica à qual deve sua propriedade de alinhamento automático. O número e o tamanho de seus rolos e a exatidão com que estes são guiados, conferem a esse rolamento uma capacidade de carga muito grande. O de tipo largo também pode suportar cargas axiais consideráveis, provenientes de qualquer direção.

### ROLAMENTOS DE CONTACTO ANGULAR

O rolamento de contacto angular de uma carreira de esferas tem as pistas dispostas de forma que a pressão exercida pelas esferas está dirigida em ângulo agudo com respeito ao eixo. Em consequência desta disposição, o rolamento é especialmente apropriado para resistir a uma grande carga axial, devendo-se montá-lo contraposto a outro rolamento que possa receber a carga axial existente em sentido contrário. Este rolamento não é desarmável.

### ROLAMENTOS DE CONTACTO ANGULAR DE 2 CARREIRAS DE ESFERAS

O rolamento de contacto angular de duas carreiras tem as pistas de maneira que as linhas de pressão formadas pelas duas carreiras de esferas se dirigem a dois pontos do eixo relativamente distante entre si. Ao contrário de outros tipos de rolamento, este tem carga prévia, que lhe permite reduzir, entre pequenos limites, os movimentos axiais do eixo, mesmo sob cargas de direção variável. Por sua construção, este rolamento é apropriado para órgãos giratórios de máquinas que requerem dois apoios, porém nos quais se dispõe de espaço para um só rolamento.

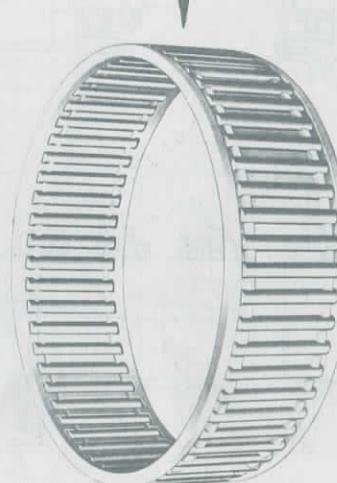

### ROLAMENTOS AXIAIS DE ESFERAS ESCORA SIMPLES

O rolamento axial de esferas de escora simples consta de uma carreira de esferas entre duas placas, uma das quais, a placa móvel, é de assento plano, enquanto que a outra, a placa fixa, pode ter assento plano ou esférico. Neste último caso, o rolamento se apoia em uma contraplaca. Os rolamentos com assento plano deveriam, sem dúvida, ser preferidos para a maioria das aplicações, porém, os de assento esférico são muito úteis em certos casos, para compensar pequenas inexatidões de fabricação das caixas. O rolamento destina-se a suportar carga axial em uma só direção.

### ROLAMENTOS DE ROLOS CÔNICOS DE UMA CARREIRA DE ESFERAS

O rolamento de rolos cônicos, graças à posição oblíqua dos rolos e da pista, é especialmente adequado para resistir a cargas radiais e axiais. Para os casos em que a carga axial é muito importante, há uma série de rolamentos cujo ângulo é muito aberto. Este rolamento deve ser montado contraposto a outro capaz de suportar os esforços axiais em sentido contrário. O rolamento é desarmável; o anel interno com seus rolos e o anel externo armam-se cada um separadamente.

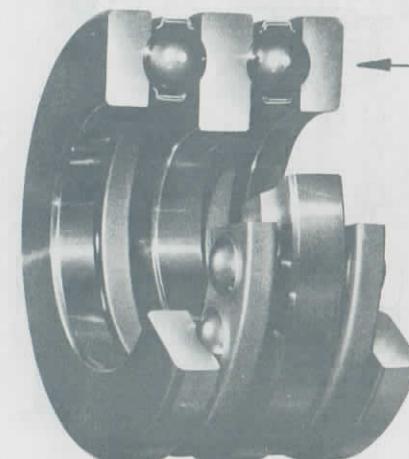

### ROLAMENTOS DE AGULHAS

Os rolamentos de agulhas, indicados para suportar esforços radiais intensos, são de pequena espessura, possibilitando, assim, o emprego de assentos mais leves e de dimensões reduzidas; apresentam alta rigidez, o que permite que suportem maiores cargas com muito menor desgaste; funcionam silenciosamente, mesmo quando são submetidos a regimes de altas rotações.

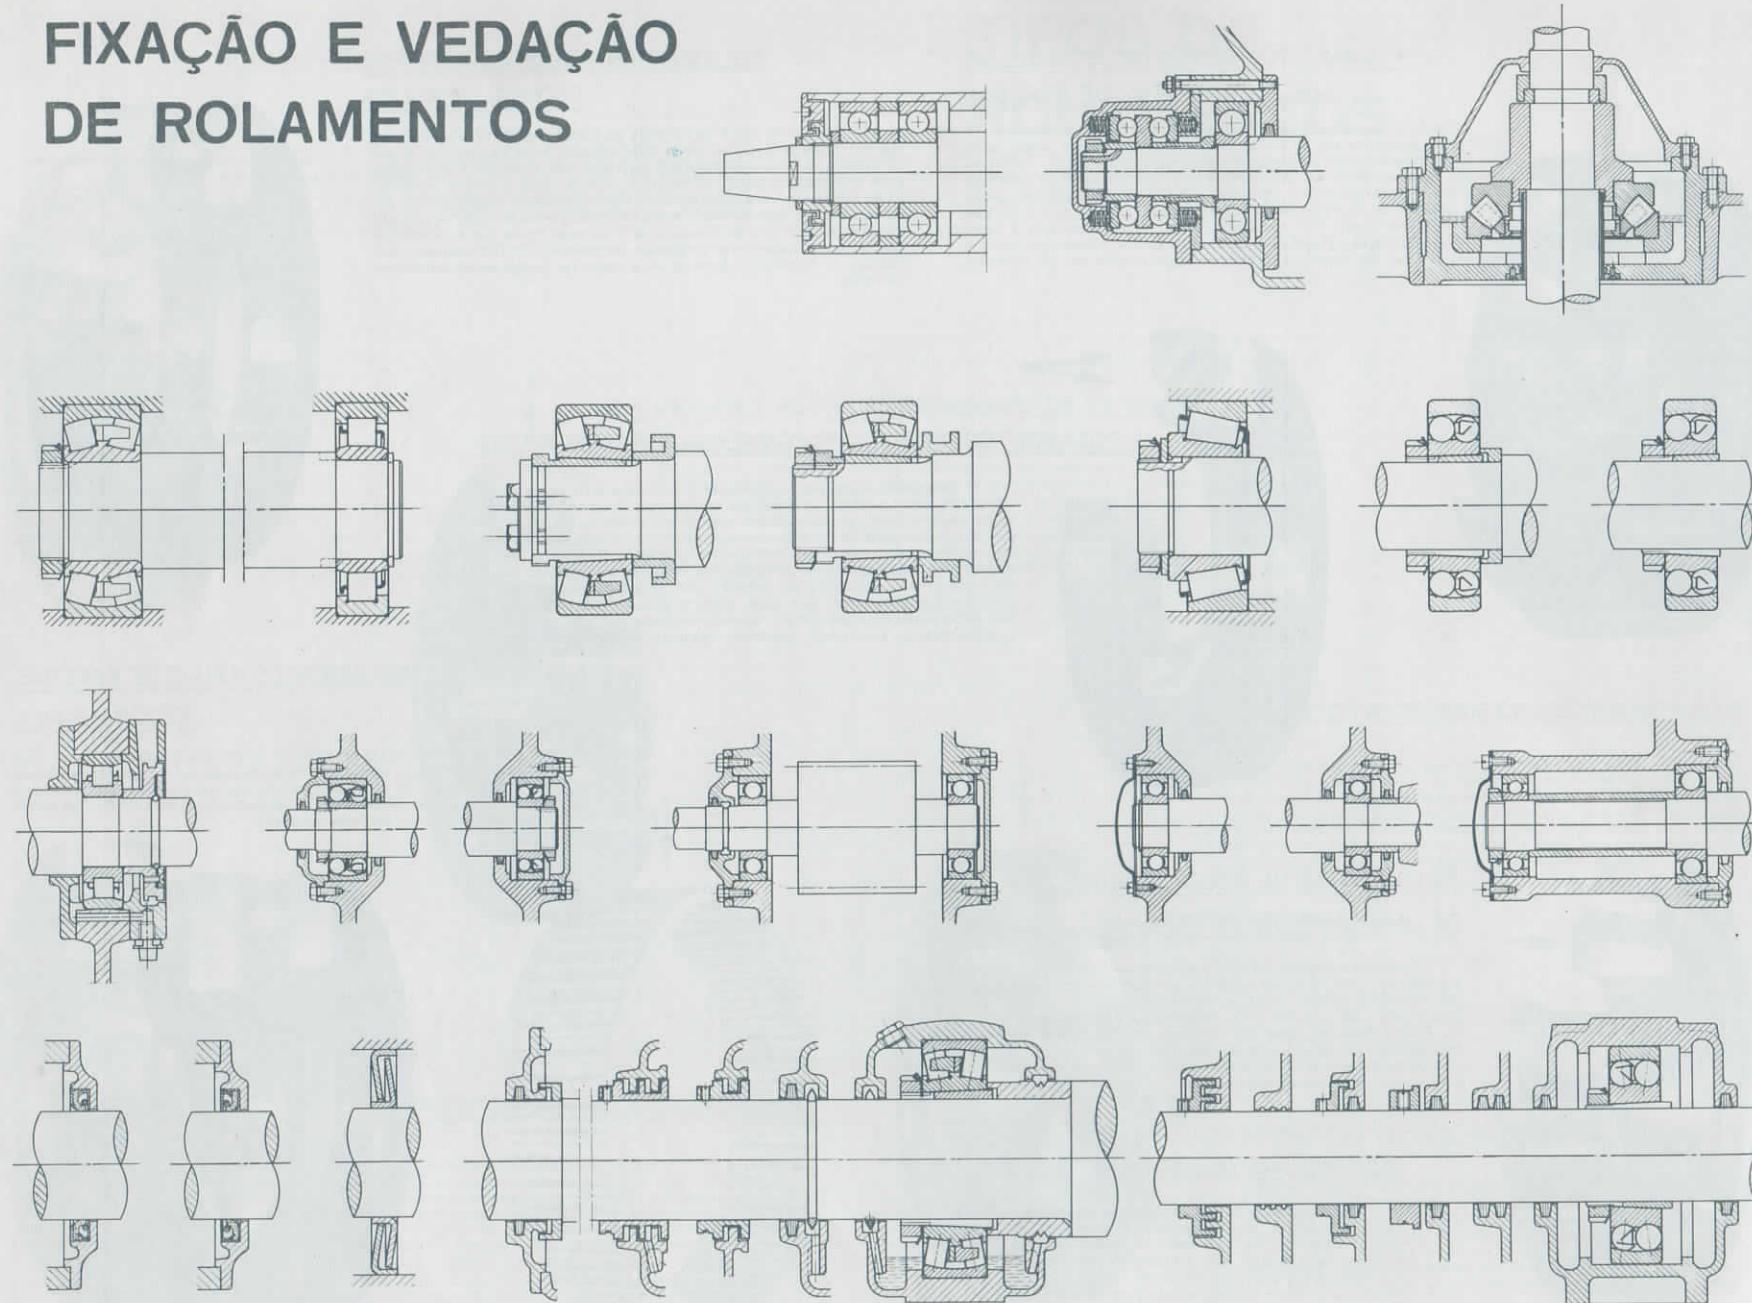

### ROLAMENTOS AXIAIS DE ESFERAS ESCORA DUPLA

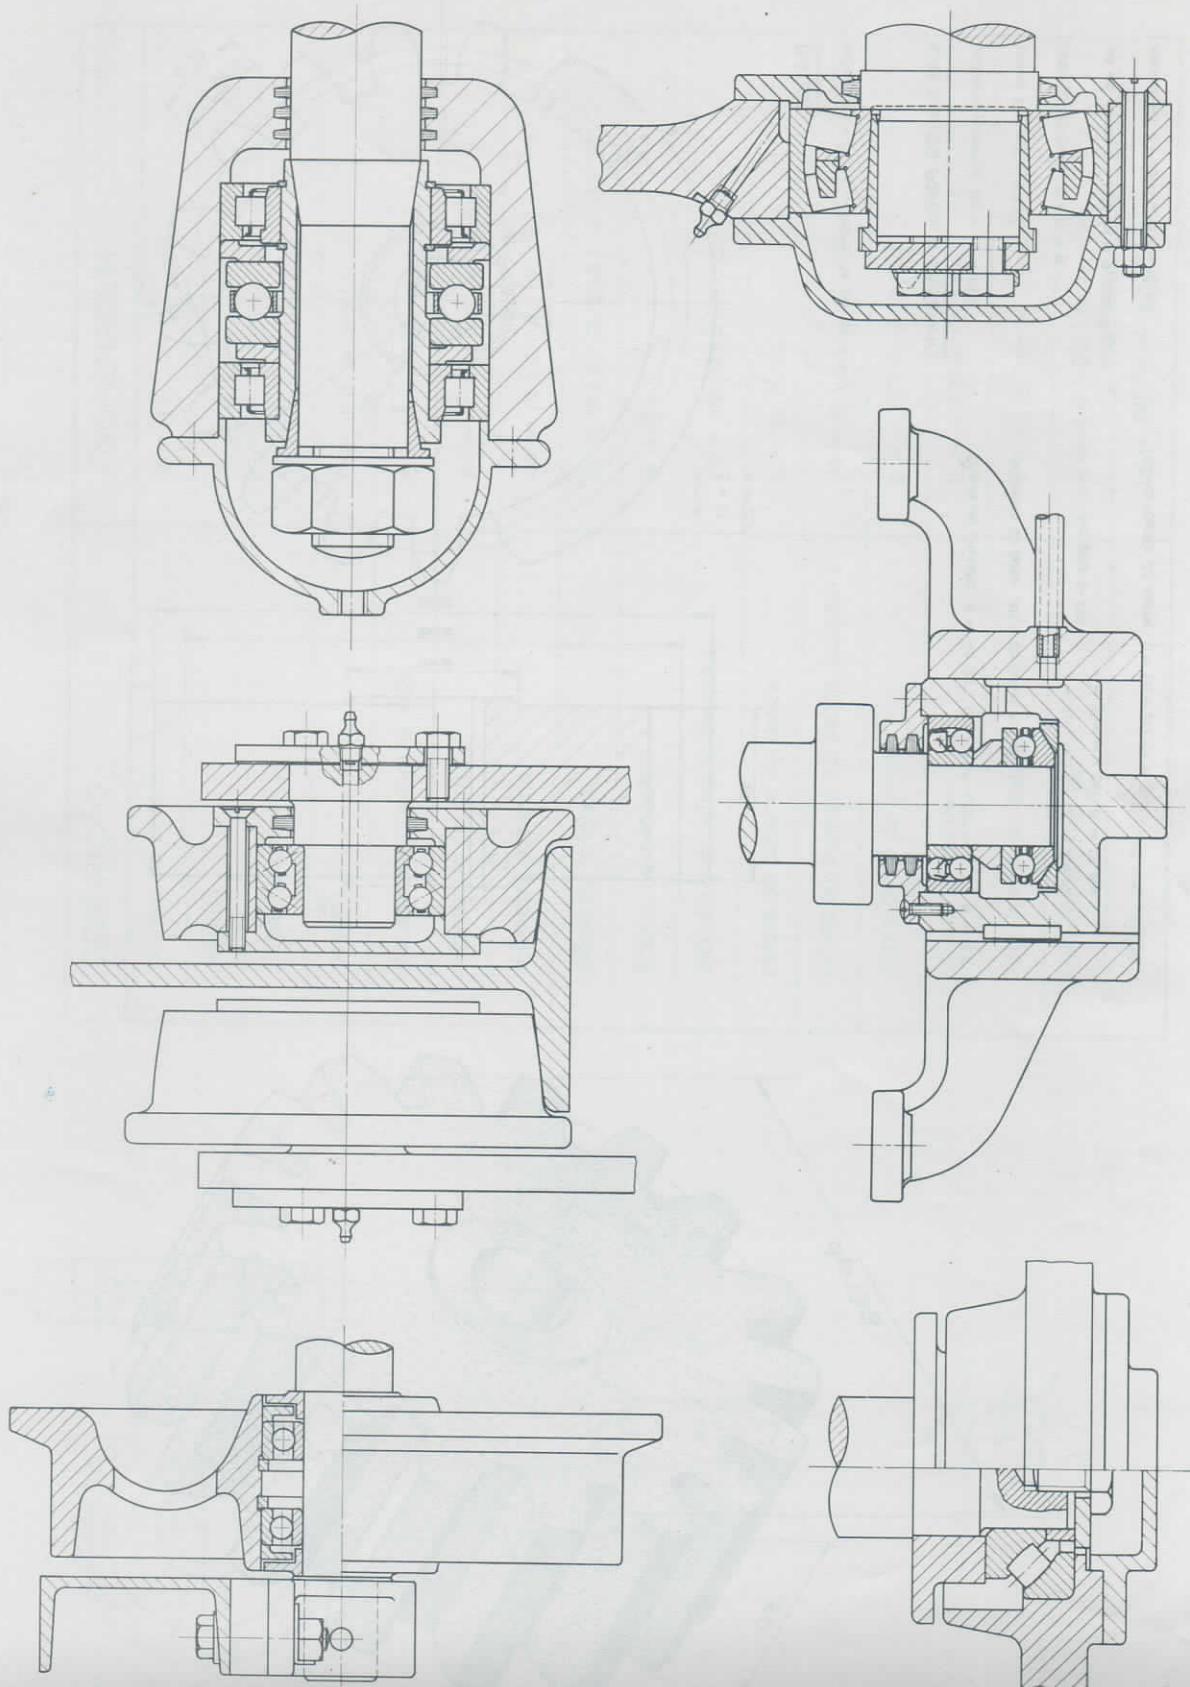

O rolamento axial de esferas de escora dupla tem duas carreiras de esferas, uma para cada direção de carga, e três placas fixas são iguais às do rolamento de escora simples, podendo ser de assento plano ou esférico. O rolamento destina-se a resistir a cargas axiais de direção variável.

# ENGRANAGENS CÔNICAS

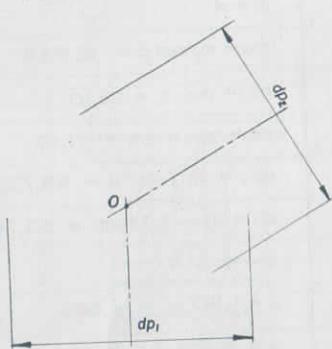

# SEQUÊNCIA DO TRAÇADO

DADOS:  $\ell$ ,  $m$ ,  $Z_1$ ,  $Z_2$

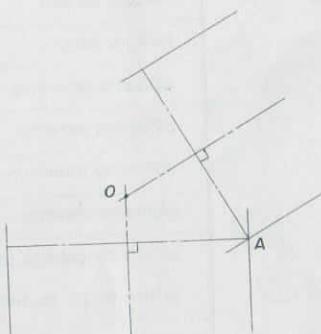

① TRAÇAR OS EIXOS.

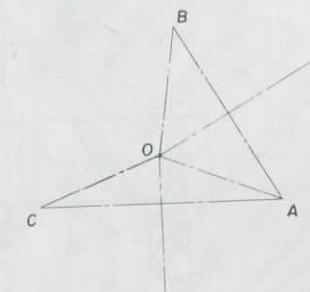

② TRAÇAR OS LUGARES GEOMÉTRICOS DOS DIÂMETROS PRIMITIVOS.  
( $dp_1 = m Z_1$ ;  $dp_2 = m Z_2$ ).

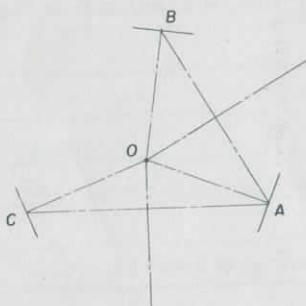

③ TRAÇAR AS PERPENDICULARES AOS EIXOS PELO PONTO A.

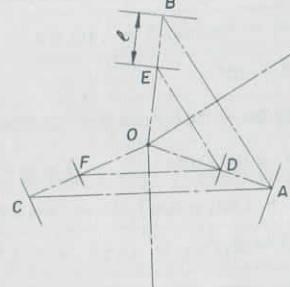

④ LIGAR OS PONTOS ABC COM O CENTRO O, OBTENDO ASSIM OS CONES PRIMITIVOS.

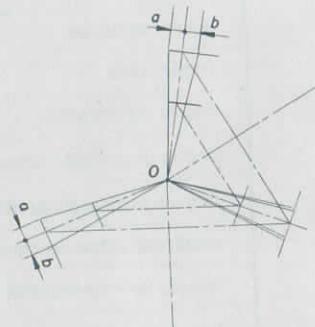

⑤ TRAÇAR AS PERPENDICULARES ÀS GERATRIZES PELOS PONTOS ABC.

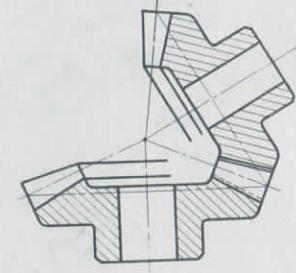

⑥ MARCAR O COMPRIMENTO  $\ell$  DO DENTE NAS GERATRIZES E TRAÇAR AS PERPENDICULARES PELOS PONTOS DEF.

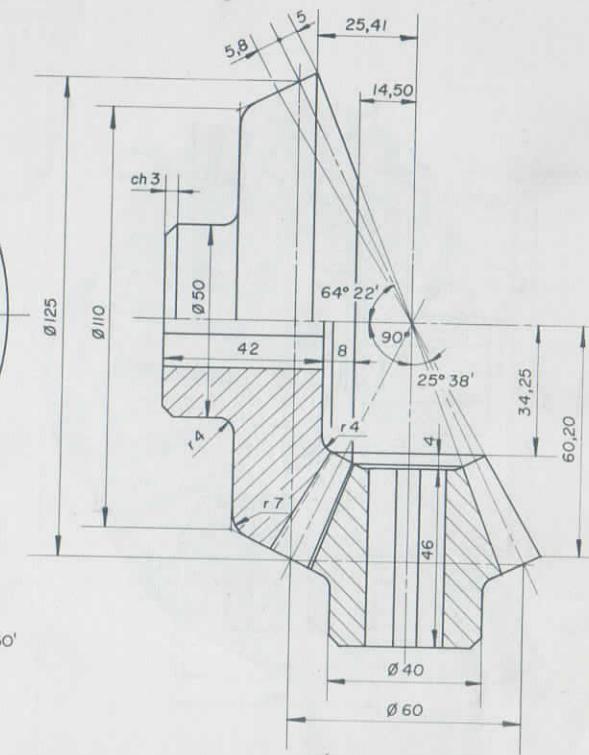

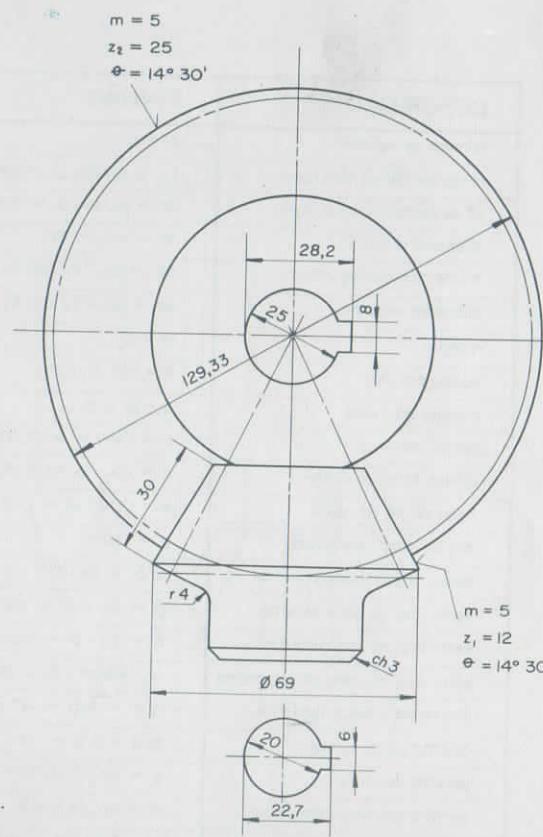

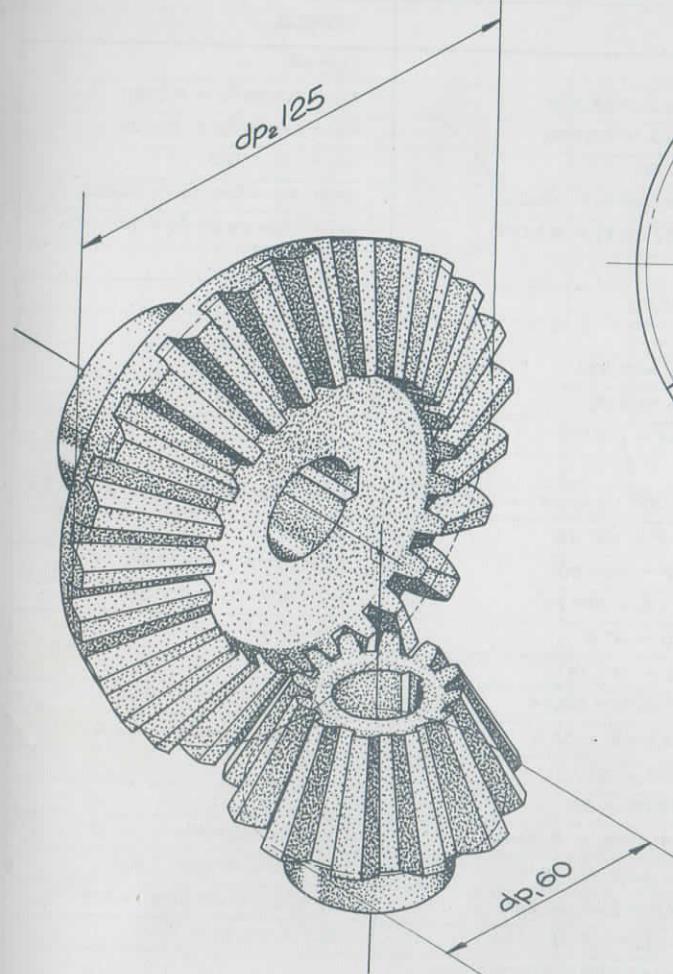

⑦ MARCAR A CABEÇA ( $a=m$ ) E O PÉ ( $b=1,167m$ ) DO DENTE.

⑧ COMPLETAR AS ENGRANAGENS COM OS DADOS DO PROJETO.

# ENGRANAGENS CÔNICAS A 90°
